Functional Description^[1]

The CY62168EV30 is a high performance CMOS static RAM organized as 2M words by 8 bits. This device features advanced circuit design to provide an ultra low active current. This is ideal for providing More Battery Life™ (MoBL®) in portable applications such as cellular telephones. The device also has an automatic power down feature that significantly reduces power consumption by 90% when addresses are not

toggling. Placing the device into standby mode reduces power consumption by more than 99% when deselected (Chip Enable 1 (\overline{CE}_1) HIGH or Chip Enable 2 (CE_2) LOW). The input and output pins (IO_0 through IO_7) are placed in a high impedance state when: the device is deselected (Chip Enable 1 (\overline{CE}_1) HIGH or Chip Enable 2 (CE_2) LOW), outputs are disabled (\overline{OE} HIGH), or a write operation is in progress (Chip Enable 1 (\overline{CE}_1) LOW and Chip Enable 2 (CE_2) HIGH and \overline{WE} LOW).

Write to the device by taking Chip Enable 1 (\overline{CE}_1) LOW and Chip Enable 2 (CE_2) HIGH and the Write Enable (\overline{WE}) input LOW. Data on the eight IO pins (IO_0 through IO_7) is then written into the location specified on the address pins (A_0 through A_{20}).

Read from the device by taking Chip Enable 1 (\overline{CE}_1) and Output Enable (\overline{OE}) LOW and Chip Enable 2 (CE_2) HIGH while forcing Write Enable (\overline{WE}) HIGH. Under these conditions, the contents of the memory location specified by the address pins will appear on the IO pins.

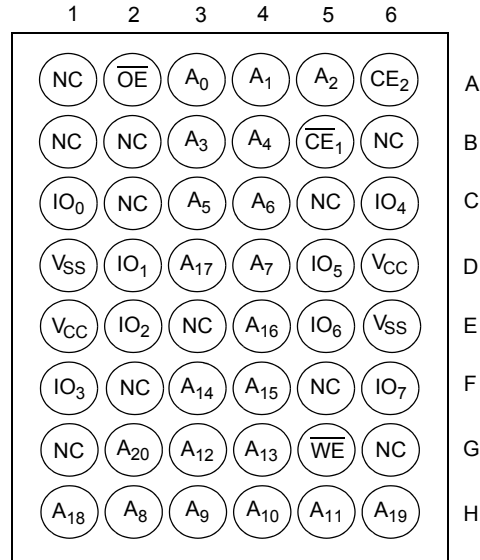

The eight input and output pins (IO_0 through IO_7) are placed in a high impedance state when the device is deselected (\overline{CE}_1 LOW and CE_2 HIGH), the outputs are disabled (\overline{OE} HIGH), or a write operation is in progress (\overline{CE}_1 LOW and CE_2 HIGH and \overline{WE} LOW). See the "Truth Table" on page 8 for a complete description of read and write modes.

Notes

- Test conditions for all parameters other than tri-state parameters assume signal transition time of 3 ns or less (1V/ns), timing reference levels of $V_{CC}(\text{typ})/2$, input pulse levels of 0 to $V_{CC}(\text{typ})$, and output loading of the specified I_{OL}/I_{OH} as shown in "AC Test Loads and Waveforms" on page 4.
- At any given temperature and voltage condition, t_{HZCE} is less than t_{LZCE} , t_{HZOE} is less than t_{LZOE} , and t_{HZWE} is less than t_{LZWE} for any given device.
- t_{HZOE} , t_{HZCE} , and t_{HZWE} transitions are measured when the outputs enter a high impedance state.
- The internal write time of the memory is defined by the overlap of \overline{WE} , $\overline{CE}_1 = V_{IL}$, and $CE_2 = V_{IH}$. All signals must be ACTIVE to initiate a write and any of these signals can terminate a write by going INACTIVE. The data input setup and hold timing should be referenced to the edge of the signal that terminates the write.

Notes

- 15. The device is continuously selected. \overline{OE} , $\overline{CE}_1 = V_{IL}$, and $CE_2 = V_{IH}$.
- 16. \overline{WE} is HIGH for read cycle.
- 17. Address valid before or similar to \overline{CE}_1 transition LOW and CE_2 transition HIGH.

Notes

18. Data IO is high impedance if $\overline{OE} = V_{IH}$.

19. If \overline{CE}_1 goes HIGH and CE_2 goes LOW simultaneously with $\overline{WE} = V_{IH}$, the output remains in a high impedance state.

20. During this period the IOs are in output state. Do not apply input signals.
