1.FUNCTIONS & FEATURES

• DEM 16217-Series LCD type:

MODULE TYPE	LCD-TYPE	LED-MODE	
DEM 16217 FDH-LR-N	FSTN Transmissive Negative	Red (Lightbox)	

Polarizer Mode : Special dark for best optics

Operating Temperature : -20°C to +70°C
 Storage Temperature : -30°C to +80°C

• Viewing Direction : 6 o'clock

Driving Scheme : 1/16 Duty Cycle, 1/5 Bias
 Power Supply Voltage : 2.7 to 5.5V (typ. 5V)

 $\begin{array}{lll} \bullet & \mathsf{V_{LCD}} \; \; (\mathsf{V_{DD}} - \mathsf{V_0}) & & : 4.5 \mathsf{V} \; (\mathsf{typ.}) \\ \bullet & \mathsf{Backlight} & : \; \mathsf{Red} \; (\mathsf{lightbox}) \\ \end{array}$

• Display contents : 16 x 2 Characters (5 x 8 dots, Format : 192 Kinds)

Internal Memory : CGROM (8,320 bits): CGRAM (64 x 8 bits)

: DDRAM (80 x 8 bits for 80 Digits)

• Interface : Easy Interface with a 4-bit or 8-bit MPU

2. MECHANICAL SPECIFICATIONS

Character Pitch : 3.55 (W) x 5.95 (H) mm
 Character Size : 2.95 (W) x 5.55 (H)mm

Character Font : 5 x 8 dots

Dot Size : 0.55 (W) x 0.65 (H) mm
 Dot Pitch : 0.60 (W) x 0.70 (H) mm

5. PIN ASSIGNMENT

Pin No.	Symbol	Function
1	VSS	Ground terminal of module.
2	VDD	Supply terminal of module 2.7Volt to 5.5Volt.
3	V0	Power Supply for liquid crystal drive.
4	RS	Register select RS = 0 (Instruction register) RS = 1 (Data register)
5	R/W	Read /Write R/W = 1 (Read) R/W = 0 (Write)
6	E	Enable
7	DB0	
8	DB1	
9	DB2	Bi-directional data bus, data transfer is performed once, thru
10	DB3	DB0 to DB7, in the case of interface data. Length is 8-bits; and
11	DB4	twice, thru DB4 to DB7 in the case of interface data length is 4-
12	DB5	bits. Upper four bits first then lower four bits.
13	DB6	
14	DB7	
L-	LED – (K)	Please also refer to 6.1 PCB drawing and description.
L+	LED + (A)	Please also refer to 6.1 PCB drawing and description.

6.1 PCB DRAWING AND DESCRIPTION

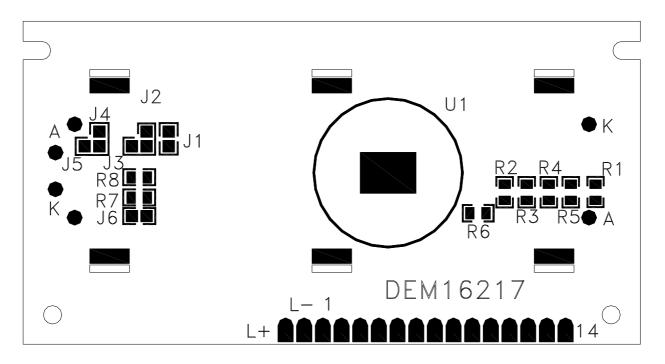

Figure 3.0

DESCRIPTION:

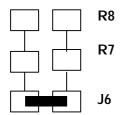

6-1-1. The polarity of the pin L- and the pin L+:

	symbol	J3,J5	12 14	LED Polarity		
symbol	state	72,10	J2, J4	15 Pin	16 Pin	
J2,J4	Each solder-bridge	Each open		Anode	Cathode	
J3,J5	Each solder-bridge		Each open	Cathode	Anode	

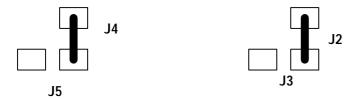

- 6-1-2. The metal-bezel should be on ground when the J1 is solder-Bridge.
- 6-1-3. The LED resistor should be bridged when the J6 is solder-Bridge.
- 6-1-4. The R7 and the R8 are the LED resistor. (R7=OPEN, R8=33 Ω).

6.2 Example application

6-2-1. The LED resistor should be bridged as following.

6-2-2. The L- pin is the anode and the L+ pin is the cathode as following.

6-2-3. The L- pin is the cathode and the L+ pin is the anode as following.

6-2-4. The metal-bezel is on ground as following.

J1

6.3 The module No. is printed on the PCB.

9.INSTRUCTION DESCRIPTION

Outline

To overcome the speed difference between the internal clock of S6A0070A and the MPU clock, S6A0070A performs internal operations by storing control information to IR or DR. The internal operation is determined according to the signal from MPU, composed of read/write and data bus (refer to table 5.)

Instruction can be divided largely into four kinds:

- (1) S6A0070A function set instructions (set display methods, set data length, etc.)
- (2) Address set instructions to internal RAM.
- (3) Data transfer instructions with internal RAM.
- (4) Others.

The address of the internal RAM is automatically increased or decreased by 1.

*NOTE: During internal operation, busy flag (DB7) is read"1". Busy flag check must be preceded by the next instruction.

When you make an MPU program with checking the busy flag (DB7), it must be necessary 1/2 fosc for executing the next instruction by falling E signal after the busy flag (DB7) goes to "0".

Contents

1) Clear display

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	0	0	0	0	0	1

Clear all the display data by writing "20H" (space code) to all DDRAM address, and set the DDRAM addresses to "00H" in the AC (address counter). Return cursor to original status, namely, bring the cursor to the left edge on first line of the display. Make entry mode increment (I/D = "1").

2) Return home

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	0	0	0	0	1	Х

Return home is the cursor return home instruction.

Set DDRAM address to "00H" in the address counter. Return cursor to its original site and return display to its original status, if shifted. Contents of DDRAM does not change.

3) Entry mode set

_	RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
	0	0	0	0	0	0	0	1	I/D	SH

Set the moving direction of cursor and display.

I/D: increment/decrement of DDRAM address is increased by 1.

When I/D="1", cursor/blink moves to right and DDRAM address is increased by 1.

When I/D="0", cursor/blink moves to left and DDRAM address is increased by 1.

CGRAM operates the same as DDRAM, when reading from or writing to CGRAM.

SH: shift of entire display

When DDRAM is in read (CGRAM read/write) operation or SH = "0", shift of entire display is not performed. If SH = "1" and in DDRAM write operation, shift of entire display is performed according to I/D value (I/D = "1": shift left, I/D = "0": shift right).

4) Display ON/OFF control

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	0	0	1	D	С	В

Control display/cursor/blink ON/OFF 1-bit register.

D: Display ON/OFF control bit

When D = "1", entire display is turned on.

When D = "0', display is turned off, but display data remains in DDRAM.

C: cursor or ON/OFF control bit

When C = "1", cursor is turned on.

When C = "0", cursor disappears in current display, but I/D register retains its data.

B: cursor blink ON/OFF control bit

When B = "1", cursor blink is on, which performs alternately between all the "1" data and display characters at the cursor position.

When B = "0", blink is off

5) Cursor or display shift

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	0	1	S/C	R/L	Χ	Χ

Without writing or reading the display data, shift right/left cursor position or display.

This instruction is used to correct or search display data. (refer to table 40

During 2-line mode display, cursor moves to the 2nd line after the 40th digit of the 1st line.

Note tat display shift is performed simultaneously in all the lines.

When displayed data is shifted repeatedly, each line shifts individually.

When display shift is performed, the contents of the address counter are not changed.

Table 4. shift patterns according to S/C and R/L bits

S/C	R/L	operation
0	0	Shift cursor to the left, AC is decreased by 1
0	1	Shift cursor to the right, AC is decreased by 1
1	0	Shift all the display to the left, cursor moves according to the display
1	1	Shift all the display to the right, cursor moves according to the display

6) Function set

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	0	DL	Ν	F	Χ	Χ

DL: Interface data length control bit

When DL="1", it means 8-bit bus mode with MPU.

When DL = "0", it means 4-bit bus mode with MPU. So to speak, DL is a signal to select 8-bit or 4-bit bus mode. When 4- bit bus mode, it needs to transfer 4-bit data in two parts.

N: display line number control bit

When N = "0", it means 1-line display mode.

When N = "1", it means 2-line display mode.

F: display font type control bit

When F = "0", 5 x 7 dots format display mode.

When F = "1", 5 x 10 dots format display mode.

DEM 16217 FDH-LR-N

Product Specification

7) Set CGRAM address

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	1	AC5	AC4	AC3	AC2	AC1	AC0

Set CGRAM address to AC.

THIS INSTRUCTION MAKES CGRAM data available from MPU.

8) Set DDRAM address

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	1	AC6	AC5	AC4	AC3	AC2	AC1	AC0

Set DDRAM address to AC

This instruction makes DDRAM data available from MPU.

When in 1-line display mode (N=0), DDRAM address is from "00H" to "4FH".

In 2-line display mode (N=1), DDRAM address in the 1st line is from "00H" to "27H", and DDRAM address in the 2nd line is from "40H" to "67H".

9) Read busy flag & address

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	BF	AC6	AC5	AC4	AC3	AC2	AC1	AC0

This instruction shows whether S6A0070A is in internal operation or not. If the resultant BF is "1", it means the internal operation is in progress and your have to wait until BF is low. Then the next instruction can be performed. In this instruction your can also read the value of the address counter.

10) Write data to RAM

RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
1	0	D7	D6	D5	D4	D3	D2	D1	D0

Write binary 8-bit data to DDRAM / CGRAM

The selection of RAM from DDRAM, and CGRAM, is set by the previous address set instruction: DDRAM address set, and CGRAM address set. RAM set instruction can also determine the AC direction to RAM.

After write operation, the address is automatically increased/decreased by 1, according to the entry mode.

11) Read data to RAM

	RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
Ī	1	1	D7	D6	D5	D4	D3	D2	D1	D0

Read binary 8-bit data from DDRAM/CGRAM.

The selection of RAM is set by the previous address set instruction. If the address set instruction of RAM is not performed before this instruction, the data that is read first is invalid, because the direction of AC is not determined. If you read RAM data several times without RAM address set instruction before read operation, you can get correct RAM data. In the case of DDRAM read operation, cursor shift instruction plays the same role as DDRAM address set instruction; it also transfers RAM data to the output data register.

After read operation the address counter is automatically increased/decreased by 1 according to the entry mode. After CGRAM read operation, display shift may not be executed correctly.

In the case of RAM write operation, after this AC is increased/decreased by 1 like read operation. At his time, AC indicates the next address position, but your can read only the previous data by the read instruction.

DEM 16217 FDH-LR-N

Product Specification

Table 5.instruction table

					Instru	uction	Code					Execution
Instruction	RS	R/W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0	Description	time (fosc= 270kHz)
Clear Display	0	0	0	0	0	0	0	0	0	1	Write "20H" to DDRAM and set DDRAM address to "00H" from AC.	1.53 ms
Return Home	0	0	0	0	0	0	0	0	1	Х	Set DDRAM address to "00H" from AC and return cursor to its original position if shifted.	1.53ms
Entry Mode set	0	0	0	0	0	0	0	1	I/D	SH	Assign cursor moving direction and enable the shift of entire display.	39us
Display ON/OFF Control	0	0	0	0	0	0	1	D	С	В	Set display (D), cursor(C), and blinking of cursor (B) on/off control bit.	39us
Cursor or Display shift	0	0	0	0	0	1	S/C	R/L	Х	Х	Set cursor moving and display shift control bit, and the direction without changing of DDRAM data.	39us
Function set	0	0	0	0	1	DL	N	F	Х	X	Set interface data length (DL:4-bit/8-bit), numbers of display line (N:1-line/2-line, display font type (F:0)	39us
Set CGRAM address	0	0	0	1	AC5	AC4	AC3	AC2	AC1	AC0	Set CGRAM address in address counter.	39us
Set DDRAM address	0	0	1	AC6	AC5	AC4	AC3	AC2	AC1	AC0	Set DDRAM address in address counter.	39us
Read busy flag and address	0	1	BF	AC6	AC5	AC4	AC3	AC2	AC1	AC0	Whether during internal operation or not can be known by reading BF. The contents of address counter can also be read.	Ous
Write data to RAM	1	0	D7	D6	D5	D4	D3	D2	D1	D0	Write data into internal RAM (DDRAM/CGRAM).	43us
Read data to RAM	1	1	D7	D6	D5	D4	D3	D2	D1	D0	Read data into internal RAM (DDRAM/CGRAM).	43us

NOTE: when you make an MPU program with checking the busy flag (DB7), it must be necessary 1/2 Fosc for executing the next instruction by falling E signal after the busy flag (DB7) goes to "0".

10. INTERFACE WITH MPU IN BUS MODE

1) Interface with 8-bit MPU

When interfacing data length are 8-bit, transfer is performed all at once through 8-ports, from DB0 to DB7. An example of the timing sequence is shown below.

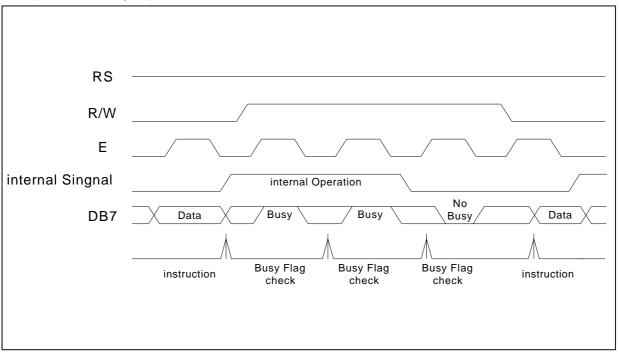

Figure 6.0 Example of 8-bit bus mode timing diagram

2) Interface with 4-bit MPU

When interfacing data length are 4-bit, only 4 ports, from DB4 to DB7, are used as data bus.

At first, higher 4-bit (in case of 8-bit bus mode, the contents of DB4 to DB7) are transferred, and then the lower 4-bit (in case of 8-bit bus mode, the contents of DB0 to DB3) are transferred. So transfer is performed in two parts. Busy flag outputs" 1" after the second transfer are ended.

Example of timing sequence is shown below.

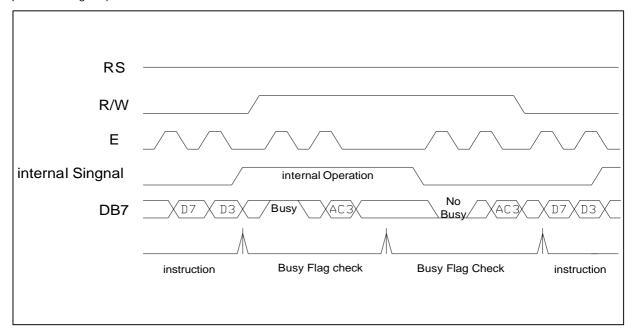

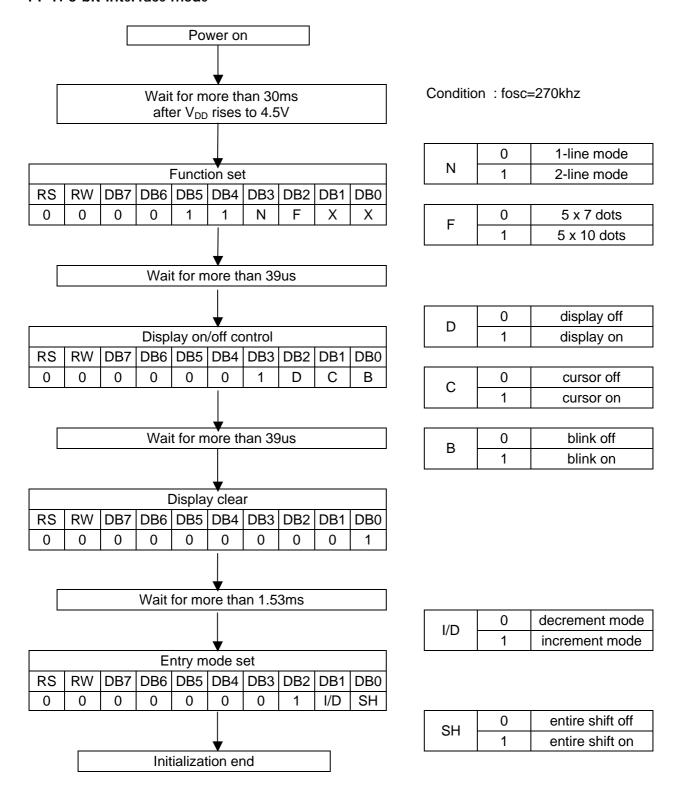

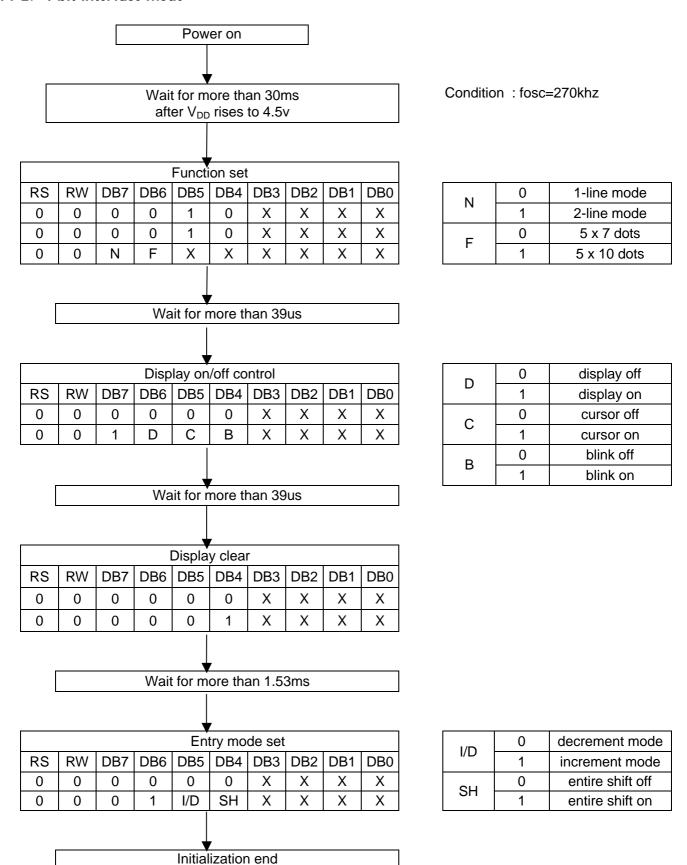

Figure 7.0 Example of 4-bit bus mode timing diagram

16. LCD Modules Handling Precautions

- The display panel is made of glass. Do not subject it to a mechanical shock by dropping it from a high place, etc.
- If the display panel is damaged and the liquid crystal substance inside it leaks out, do not get any in your mouth. If the substance come into contact with your skin or clothes promptly wash it off using soap and water.
- Do not apply excessive force to the display surface or the adjoining areas since this may cause the color tone to vary.
- The polarizer covering the display surface of the LCD module is soft and easily scratched. Handle this polarize carefully.
- Please remove the protection film on top of polarizer before using the LCD-display.
- To prevent destruction of the elements by static electricity, be careful to maintain an optimum work environment.
 - -Be sure to ground the body when handling the LCD module.
 - -Tools required for assembly, such as soldering irons, must be properly grounded.
 - -To reduce the amount of static electricity generated, do not conduct assembly and other work under dry conditions.
 - -The LCD module is coated with a film to protect the display surface. Exercise care when peeling off this protective film since static electricity may be generated.

Storage precautions

When storing the LCD modules, avoid exposure to direct sunlight or to the light of fluorescent lamps. Keep the modules in bags designed to prevent static electricity charging under low temperature / normal humidity conditions (avoid high temperature / high humidity and low temperatures below 0° C). Whenever possible, the LCD modules should be stored in the same conditions in which they were shipped from our company.

17. Others

- Liquid crystals solidify at low temperature (below the storage temperature range) leading to defective orientation of liquid crystal or the generation of air bubbles (black or white). Air bubbles may also be generated if the module is subjected to a strong shock at a low temperature.
- If the LCD modules have been operating for a long time showing the same display patterns may remain on the screen as ghost images and a slight contrast irregularity may also appear. Abnormal operating status can be resumed to be normal condition by suspending use for some time. It should be noted that this phenomena does not adversely affect performance reliability.
- To minimize the performance degradation of the LCD modules resulting from caused by static electricity, etc. exercise care to avoid holding the following sections when handling the modules:
 - Exposed area of the printed circuit board
 - Terminal electrode sections
