1 μ A, 4-Bump UCSP/SOT23, Precision Current-Sense Amplifier

MAX9634

General Description

The MAX9634 high-side current-sense amplifier offers precision accuracy specifications of V_{OS} less than 250 μ V (max) and gain error less than 0.5% (max). Quiescent supply current is an ultra-low 1 μ A. The MAX9634 fits in a tiny, 1mm x 1mm UCSP™ package size or a 5-pin SOT23 package, making the part ideal for applications in notebook computers, cell phones, PDAs, and all battery-operated portable devices where accuracy, low quiescent current, and small size are critical.

The MAX9634 features an input common-mode voltage range from 1.6V to 28V. These current-sense amplifiers have a voltage output and are offered in four gain versions: 25V/V (MAX9634T), 50V/V (MAX9634F), 100V/V (MAX9634H), and 200V/V (MAX9634W).

The four gain selections offer flexibility in the choice of the external current-sense resistor. The very low 250 μ V (max) input offset voltage allows small 25mV to 50mV full-scale V_{SENSE} voltage for very low voltage drop at full-current measurement.

The MAX9634 is offered in tiny 4-bump UCSP (1mm x 1mm x 0.6mm footprint) and 5-pin SOT23 packages specified for operation over the -40°C to +85°C extended temperature range.

Applications

Cell Phones
PDAs
Power-Management Systems
Portable/Battery-Powered Systems
Notebook Computers

Features

- ◆ Ultra-Low Supply Current of 1 μ A (max)
- ◆ Low 250 μ V (max) Input Offset Voltage
- ◆ Low < 0.5% (max) Gain Error
- ◆ Input Common Mode: +1.6V to +28V
- ◆ Voltage Output
- ◆ Four Gain Versions Available
 - 25V/V (MAX9634T)
 - 50V/V (MAX9634F)
 - 100V/V (MAX9634H)
 - 200V/V (MAX9634W)
- ◆ Tiny 1mm x 1mm x 0.6mm, 4-Bump UCSP or 5-Pin SOT23 Packages

Ordering Information

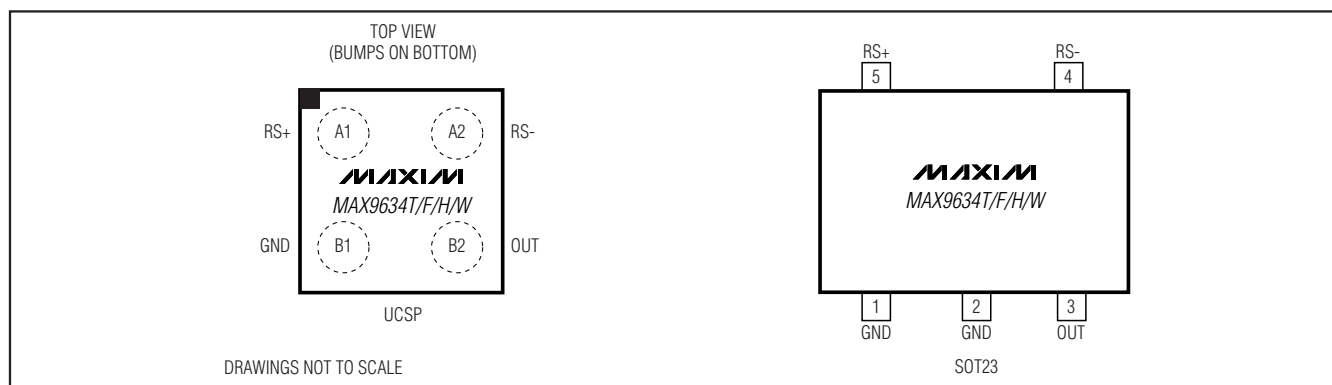

| PART | PIN-PACKAGE | GAIN (V/V) | TOP MARK |
|--------------|-------------|------------|----------|

| Continuous Input Current (any pin) | \pm 20mA |
| Continuous Power Dissipation (T _A = +70°C) | |
| 4-Bump UCSP (derate 3.0mW/°C above +70°C) | 238mW |
| 5-Pin SOT23 (derate 3.9mW/°C above +70°C) | 312mW |

| | |
|-------------------------------------|-----------------|
| Operating Temperature Range | -40°C to +85°C |
| Junction Temperature | +150°C |
| Storage Temperature Range | -65°C to +150°C |
| Bump Temperature (soldering) Reflow | +260°C |
| Lead Temperature (soldering, 10s) | +300°C |
| Soldering Temperature (reflow) | +260°C |

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ELECTRICAL CHARACTERISTICS

(V_{RS+} = V_{RS-} = 3.6V, V_{SENSE} = (V_{RS+} - V_{RS-}) = 0V, T_A = -40°C to +85°C, unless otherwise noted. Typical values are at T_A = +25°C.) (Note 1)

MAX9634

ELECTRICAL CHARACTERISTICS (continued)

($V_{RS+} = V_{RS-} = 3.6V$, $V_{SENSE} = (V_{RS+} - V_{RS-}) = 0V$, $T_A = -40^{\circ}C$ to $+85^{\circ}C$, unless otherwise noted. Typical values are at $T_A = +25^{\circ}C$.) (Note 1)

| PARAMETER | SYMBOL | CONDITIONS | MIN | TYP | MAX | UNITS |
|------------------------------------|----------|---------------------------------------|-----|-----|-----|---------|
| OUT High Voltage | V_{OH} | $V_{OH} = V_{RS-} - V_{OUT}$ (Note 6) | | 0.1 | 0.2 | V |
| Small-Signal Bandwidth (Note 5) | BW | $V_{SENSE} = 50mV$, gain = 25 | | 125 | | kHz |
| | | $V_{SENSE} = 50mV$, gain = 50 | | 60 | | |
| | | $V_{SENSE} = 50mV$, gain = 100 | | 30 | | |
| | | $V_{SENSE} = 50mV$, gain = 200 | | 15 | | |
| Output Settling Time | t_s | 1% final value, $V_{SENSE} = 50mV$ | | 100 | | μs |
| Power-Up Time | t_{ON} | 1% final value, $V_{SENSE} = 50mV$ | | 200 | | μs |

Note 1: All devices are 100% production tested at $T_A = +25^{\circ}C$. All temperature limits are guaranteed by design.

Note 2: $V_{OUT} = 0$. I_{CC} is the total current into $RS+$ plus $RS-$ pins.

Note 3: V_{OS} is extrapolated from measurements for the gain-error test.

Note 4: Gain error is calculated by applying two values of V_{SENSE} and calculating the error of the slope vs. the ideal:

Gain = 25, V_{SENSE} is 20mV and 120mV.

Gain = 50, V_{SENSE} is 10mV and 60mV.

Gain = 100, V_{SENSE} is 5mV and 30mV.

Gain = 200, V_{SENSE} is 2.5mV and 15mV.

Note 5: The device is stable for any external capacitance value.

Note 6: V_{OH} is the voltage from V_{RS-} to V_{OUT} with $V_{SENSE} = 3.6V/gain$.

| B1 | 1, 2 | GND | Ground |
| B2 | 3 | OUT | Output Voltage. V_{OUT} is proportional to $V_{SENSE} = V_{RS+} - V_{RS-}$. |

1 μ A, 4-Bump UCSP/SOT23, Precision Current-Sense Amplifier

Typical Operating Circuit

Detailed Description

The MAX9634 unidirectional high-side, current-sense amplifier features a 1.6V to 28V input common-mode range. This feature allows the monitoring of current out of a battery with a voltage as low as 1.6V. The MAX9634 monitors current through a current-sense resistor and amplifies the voltage across that resistor.

The MAX9634 is a unidirectional current-sense amplifier that has a well-established history. An op amp is used to force the current through an internal gain resistor at RS+, which has a value of R₁, such that its voltage drop equals the voltage drop across an external sense resistor, R_{SENSE}. There is an internal resistor at RS- with the

same value as R₁ to minimize offset voltage. The current through R₁ is sourced by a high-voltage p-channel FET. Its source current is the same as its drain current, which flows through a second gain resistor, R_{OUT}. This produces an output voltage, V_{OUT}, whose magnitude is I_{LOAD} × R_{SENSE} × R_{OUT}/R₁. The gain accuracy is based on the matching of the two gain resistors R₁ and R_{OUT} (see Table 1). Total gain = 25V/V for the MAX9634T, 50V/V for the MAX9634F, 100V/V for the MAX9634H, and 200V/V for the MAX9634W. The output is protected from input overdrive by use of an output current-limiting circuit of 7mA (typical) and a 6V clamp protection circuit.

**Table 1. Internal Gain-Setting Resistors
(Typical Values)**

| GAIN (V/V) | R ₁ (Ω) | R _{OUT} (kΩ) |
|---------------|-----------------------|--------------------------|
| 200 | 100 | 20 |
| 100 | 100 | 10 |
| 50 | 200 | 10 |
| 25 | 400 | 10 |

Applications Information

Choosing the Sense Resistor

Choose R_{SENSE} based on the following criteria:

Voltage Loss

A high R_{SENSE} value causes the power-source voltage to drop due to IR loss. For minimal voltage loss, use the lowest R_{SENSE} value.

1μA, 4-Bump UCSP/SOT23, Precision Current-Sense Amplifier

MAX9634

OUT Swing vs. V_{RS+} and V_{SENSE}

The MAX9634 is unique because the supply voltage is the input common-mode voltage (the average voltage at $RS+$ and $RS-$). There is no separate V_{CC} supply voltage pin. Therefore, the OUT voltage swing is limited by the minimum voltage at $RS+$.

$$V_{OUT}(\text{max}) = V_{RS+}(\text{min}) - V_{SENSE}(\text{max}) - V_{OH}$$

and:

$$R_{SENSE} = \frac{V_{OUT}(\text{max})}{G \times I_{LOAD}(\text{max})}$$

V_{SENSE} full scale should be less than $V_{OUT}/GAIN$ at the minimum $RS+$ voltage. For best performance with a 3.6V supply voltage, select R_{SENSE} to provide approximately 120mV (gain of 25V/V), 60mV (gain of 50V/V), 30mV (gain of 100V/V), or 15mV (gain of 200V/V) of sense voltage for the full-scale current in each application. These can be increased by use of a higher minimum input voltage.

Accuracy

In the linear region ($V_{OUT} < V_{OUT}(\text{max})$), there are two components to accuracy: input offset voltage (V_{OS}) and gain error (GE). For the MAX9634, $V_{OS} = 250\mu\text{V}(\text{max})$ and gain error is 0.5% (max). Use the linear equation:

$$V_{OUT} = (\text{gain} \pm \text{GE}) \times V_{SENSE} \pm (\text{gain} \times V_{OS})$$

to calculate total error. A high R_{SENSE} value allows lower currents to be measured more accurately because offsets are less significant when the sense voltage is larger.

Efficiency and Power Dissipation

At high current levels, the I^2R losses in R_{SENSE} can be significant. Take this into consideration when choosing the resistor value and its power dissipation (wattage) rating. Also, the sense resistor's value might drift if it is allowed to heat up excessively. The precision V_{OS} of the MAX9634 allows the use of small sense resistors to reduce power dissipation and reduce hot spots.

Kelvin Connections

Because of the high currents that flow through R_{SENSE} , take care to eliminate parasitic trace resistance from causing errors in the sense voltage. Either use a four-terminal current-sense resistor or use Kelvin (force and sense) PCB layout techniques.

Optional Output Filter Capacitor

When designing a system that uses a sample-and-hold stage in the ADC, the sampling capacitor momentarily loads OUT and causes a drop in the output voltage. If sampling time is very short (less than a microsecond), consider using a ceramic capacitor across OUT and GND to hold V_{OUT} constant during sampling. This also decreases the small-signal bandwidth of the current-sense amplifier and reduces noise at OUT.

1 μ A, 4-Bump UCSP/SOT23, Precision Current-Sense Amplifier

Figure 1. Bidirectional Application

Bidirectional Application

Battery-powered systems may require a precise bidirectional current-sense amplifier to accurately monitor the battery's charge and discharge currents. Measurements of the two separate outputs with respect to GND yields an accurate measure of the charge and discharge currents, respectively (Figure 1).
