

# Low-Power Video Switches for Dual SCART Connectors

MAX9655/MAX9656

## General Description

The MAX9655/MAX9656 dual SCART switches route video signals between a set-top box decoder chip and two external SCART connectors. Under the control of the TV\_SEL logic input, the MAX9655 selects whether the CVBS and RGB signals from the encoder or the VCR SCART are routed to the TV SCART. The CVBS signal from the encoder is always routed to the VCR SCART.

The MAX9656 is similar to the MAX9655 except that under the control of the VCR\_SEL logic input, the MAX9656 selects whether the CVBS signal from the encoder or the TV SCART is routed to the VCR SCART. The MAX9656 also features a low-power shutdown mode, in which quiescent current falls to 35µA.

The incoming video signals must be AC-coupled to the inputs, which have sync-tip clamps to set the internal DC level. After the input stages, multiplexers select which video signals are routed to the reconstruction filters and output amplifiers. The reconstruction filters are optimized for standard-definition signals and typically have ±1dB passband flatness out to 9.5MHz and 47dB attenuation at 27MHz.

The amplifiers have 2V/V gain, and the outputs can be DC-coupled to a 75Ω load, which is the equivalent of two video loads, or AC-coupled to a 150Ω load.

## Applications

SCART Set-Top Boxes

## Features

- ◆ Dual SCART Support for Video Signals
- ◆ Supports CVBS Input from TV SCART (MAX9656)
- ◆ Reconstruction Filters with 9.5MHz Passband and 47dB Attenuation at 27MHz
- ◆ Fixed Gain of 2V/V
- ◆ Input Sync-Tip Clamps
- ◆ 2.7V to 3.6V Single-Supply Operation

## Ordering Information

PART	PIN-PACKAGE	TV SCART CVBS RETURN SUPPORT
MAX9655AEE+	16 QSOP	No
MAX9656AEP+*	20 QSOP	Yes

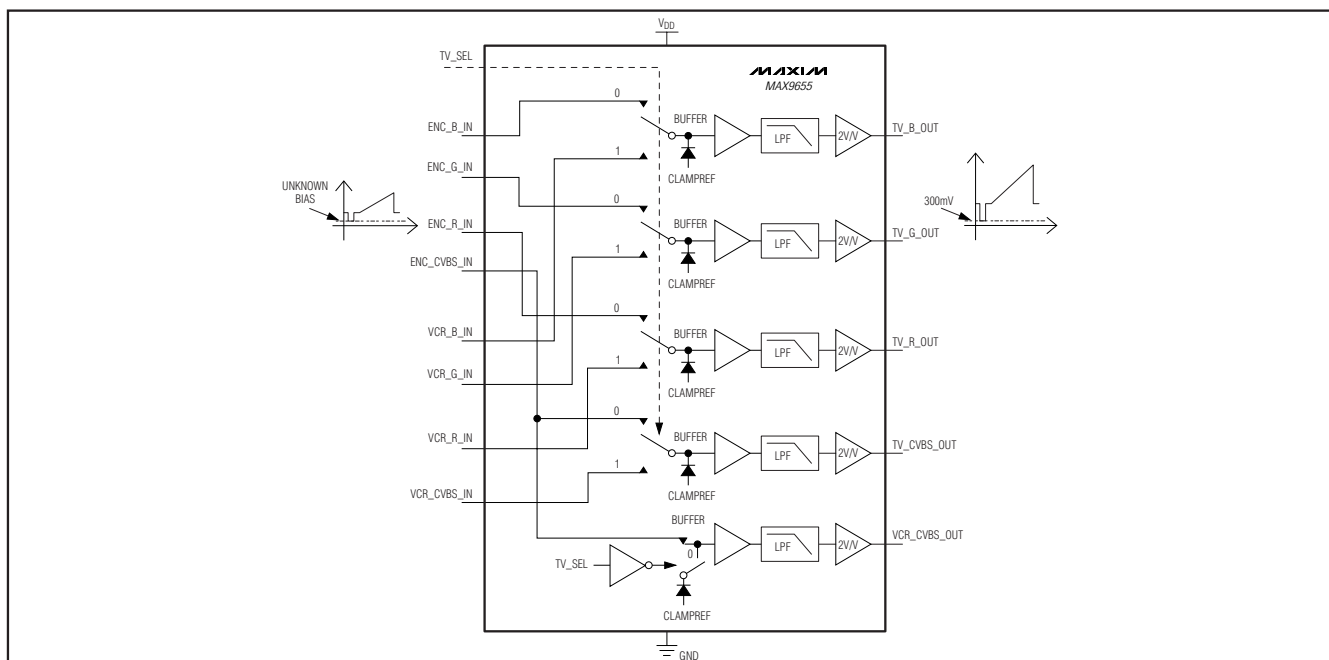

**Note:** All devices are specified over the -40°C to +125°C operating temperature range.

+ Denotes a lead-free/RoHS-compliant package.

\* Future product—contact factory for availability.

Pin Configurations and Typical Application Circuits appear at end of data sheet.

## Functional Diagram

## Pin Description

MAX9655/MAX9656

PIN		NAME	FUNCTION
MAX9655	MAX9656		
1	2	ENC_B_IN	Encoder Blue Video Input. AC-couple the signal through a 0.1µF capacitor.
2	3	ENC_G_IN	Encoder Green Video Input. AC-couple the signal through a 0.1µF capacitor.
3	4	ENC_R_IN	Encoder Red Video Input. AC-couple the signal through a 0.1µF capacitor.
4	5	ENC_CVBS_IN	Encoder Composite Video Input. AC-couple the signal through a 0.1µF capacitor.
5	6	VCR_B_IN	VCR SCART Blue Video Input. AC-couple the signal through a 0.1µF capacitor.
6	7	VCR_G_IN	VCR SCART Green Video Input. AC-couple the signal through a 0.1µF capacitor.
7	8	VCR_R_IN	VCR SCART Red Video Input. AC-couple the signal through a 0.1µF capacitor.
8	9	VCR_CVBS_IN	VCR SCART Composite Video Input. AC-couple the signal through a 0.1µF capacitor.
9	11	GND	Ground
10	13	VCR_CVBS_OUT	VCR SCART Composite Video Output. The sync tip is biased at 0.3V.
11	14	TV_CVBS_OUT	TV SCART Composite Video Output. The sync tip is biased at 0.3V.
12	15	TV_R_OUT	TV SCART Red Video Output. The sync tip is biased at 0.3V.
13	16	TV_G_OUT	TV SCART Green Video Output. The sync tip is biased at 0.3V.
14	17	TV_B_OUT	TV SCART Blue Video Output. The sync tip is biased at 0.3V.
15	18	TV_SEL	TV SCART Output Selection. Connect to GND to route the encoder video signals to the TV SCART outputs. Connect to V <sub>DD</sub> to route the VCR SCART video signals to the TV SCART outputs.
16	19	V <sub>DD</sub>	Positive Power Supply. Bypass with 0.1µF ceramic capacitors to GND.
—	1	TV_CVBS_IN	Television SCART Composite Video Input. AC-couple the signal through a 0.1µF capacitor.
—	10	N.C.	No Connection. Not internally connected.
—	12	$\overline{\text{SHDN}}$	Active-Low Shutdown Logic Input. Connect to GND to place device in shutdown. Connect to V <sub>DD</sub> for normal operation.
—	20	VCR_SEL	VCR SCART Output Selection. Connect to GND to route ENC_CVBS_IN to the VCR SCART CVBS output. Connect to V <sub>DD</sub> to route TV_CVBS_IN to the VCR SCART CVBS output.

### Detailed Description

A MAX9655 or a MAX9656 can comprise the video portion of a low-cost, dual SCART solution in set-top boxes with a subset of the full SCART functions. The MAX9655/MAX9656 select whether the CVBS, red, green, and blue video signals from the encoder or the VCR SCART are routed to the TV SCART. The MAX9655/MAX9656 support the output of one CVBS signal to the VCR SCART. In the MAX9655, the CVBS signal from the encoder is routed to the VCR SCART.

In the MAX9656, the CVBS signal routed to the VCR SCART can come from the encoder or TV SCART. In the typical usage case, the VCR (or DVD recorder) records a television program from the set-top box. In such a case, the encoder would be the source of the

CVBS signal. Support for the TV SCART CVBS return path is useful when a person wants to record on his VCR (or more likely DVD recorder) a television program received through the television's antenna. The television program is transmitted from the television to the set-top box and then to the VCR.

Both the MAX9655 and MAX9656 have integrated reconstruction filters so that when the encoder video signals are routed to the TV SCART or the VCR SCART, the steps and spikes left by the video digital-to-analog converter (DAC) are smoothed away. Although the incoming video signals from the VCR SCART are assumed to be filtered already, the reconstruction filter has wide enough bandwidth so that the video signals from the VCR SCART are not degraded.

## Low-Power Video Switches for Dual SCART Connectors

The incoming video signals can have any DC bias because the input sync-tip clamps restore the DC level. The output amplifiers have a gain of 2V/V. The MAX9655/MAX9656 operate from a single 3.3V supply and consume low quiescent power and low average power. In addition, the MAX9656 also has shutdown mode.

### Operating Modes

TV\_SEL controls whether the encoder or VCR video signals are sent to the TV SCART. See Table 1.

On the MAX9656, VCR\_SEL controls whether the CVBS signal from the TV SCART or the encoder is sent to the VCR SCART. SHDN controls whether the device is on or off. See Tables 2 and 3. In shutdown, the outputs of the MAX9656 are high impedance.

### Input

Every video signal must be AC-coupled to the MAX9655/MAX9656 through 0.1 $\mu$ F capacitors. The MAX9655/MAX9656 have sync-tip clamps and bias circuits to restore the DC level of the video signal after the input coupling capacitor. When a video input is selected, the input has a sync-tip clamp, which accepts video signals that have sync pulses or that reach their minimum level during sync. Composite video with blanking and sync (CVBS) is an example of a video signal with sync pulses. The red, green, and blue signals in an RGBS signal set are examples of signals that return to their blank level during sync. The sync-tip voltage is internally set to 300mV.

When a video input is not selected, the inputs to the MAX9655 and the MAX9656 do not distort the video signal in case the video source is driving video signals to another video circuit such as a video multiplexer. The inputs are biased at  $V_{DD}/3$ , which is sufficiently above ground so that the ESD diodes never forward bias as the video signal changes. The input resistance

**Table 1. TV\_SEL Logic (Applicable to Both the MAX9655 and the MAX9656)**

LOGIC STATE	MODE
Low	Encoder video signals are routed to the TV SCART.
High	VCR SCART video signals are routed to the TV SCART.

**Table 2. VCR\_SEL Logic (Only Applicable to the MAX9656)**

LOGIC STATE	MODE
Low	CVBS signal from encoder is routed to the VCR SCART.
High	CVBS signal from the TV SCART is routed to the VCR SCART.

**Table 3. SHDN Logic (Only Applicable to the MAX9656)**

LOGIC STATE	MODE
Low	Off
High	On

is 220k $\Omega$ , which presents negligible loading on the video current DAC. The sole exception to this condition is ENC\_CVBS\_IN (MAX9655), in which the input circuit is always a sync-tip clamp. Table 4 summarizes which input circuit is active on the inputs of the MAX9655 depending on TV\_SEL. Table 5 summarizes which input circuit is active on the inputs of the MAX9656 depending on TV\_SEL and VCR\_SEL.

**Table 4. MAX9655 Input Circuit of Input as Determined by State of TV\_SEL**

INPUT	INPUT CIRCUIT (TV_SEL = LOW)	INPUT CIRCUIT (TV_SEL = HIGH)
ENC_B_IN	Sync-tip clamp	Bias
ENC_G_IN	Sync-tip clamp	Bias
ENC_R_IN	Sync-tip clamp	Bias
ENC_CVBS_IN	Sync-tip clamp	Sync-tip clamp
VCR_B_IN	Bias	Sync-tip clamp
VCR_G_IN	Bias	Sync-tip clamp
VCR_R_IN	Bias	Sync-tip clamp
VCR_CVBS_IN	Bias	Sync-tip clamp

# Low-Power Video Switches for Dual SCART Connectors

**Table 5. MAX9656 Input Circuit of Input as Determined by State of TV\_SEL**

INPUT	INPUT CIRCUIT (TV_SEL = LOW)		INPUT CIRCUIT (TV_SEL = HIGH)	
ENC_B_IN	Sync-tip clamp		Bias	
ENC_G_IN	Sync-tip clamp		Bias	
ENC_R_IN	Sync-tip clamp		Bias	
ENC_CVBS_IN	Sync-tip clamp (VCR_SEL = 0)	Sync-tip clamp (VCR_SEL = 1)	Sync-tip clamp (VCR_SEL = 0)	Bias (VCR_SEL = 1)
TV_CVBS_IN	Bias (VCR_SEL = 0)	Sync-tip clamp (VCR_SEL = 1)	Bias (VCR_SEL = 0)	Sync-tip clamp (VCR_SEL = 1)
VCR_B_IN	Bias		Sync-tip clamp	
VCR_G_IN	Bias		Sync-tip clamp	
VCR_R_IN	Bias		Sync-tip clamp	
VCR_CVBS_IN	Bias		Sync-tip clamp	

**Note:** VCR\_SEL = X (don't care), except where noted.

When the MAX9656 is in shutdown, its inputs are biased at the same voltage and present the same input resistance as unselected inputs.

### Video Filter

The MAX9655/MAX9656 video filter features  $\pm 1$ dB passband out to 9.5MHz and 47dB attenuation at 27MHz, making the filter suitable for standard-definition video signals from all sources (e.g., broadcast and DVD). Broadcast video signals are channel limited: NTSC signals have 4.2MHz bandwidth, and PAL signals have 5MHz bandwidth. Video signals from a DVD player, however, are not channel limited; so the bandwidth of DVD video signals can approach the Nyquist limit of 6.75MHz. Recommendation: ITU-R BT.601-5 specifies 13.5MHz as the sampling rate for standard-definition video. Therefore, the maximum bandwidth of the signal is 6.75MHz. To ease the filtering requirements, most modern video systems oversample by two times, clocking the video current DAC at 27MHz.

### Outputs

The video output amplifiers can both source and sink load current, allowing output loads to be DC- or AC-coupled. The amplifier output stage needs approximately 300mV of headroom from either supply rail. The devices have an internal level-shift circuit that positions the sync tip at approximately 300mV at the output.

If the supply voltage is greater than 3.135V (5% below a 3.3V supply), each amplifier can drive two DC-coupled video loads to ground. If the supply is less than 3.135V, each amplifier can drive only one DC-coupled or AC-coupled video load.

## Applications Information

### Audio Switch for Dual SCART Connectors

In addition to video signals, SCART connectors also support left and right audio signals that are full duplex. Figure 1 shows a matching audio switch for the MAX9655. Notice that it can be made from low-cost, discrete components. It is assumed that the set-top box chip generates the left and right audio signals directly, or the set-top box chip sends an I<sup>2</sup>S stream to a stereo audio DAC that generates the left and right audio signals. In both cases, the audio signals are filtered and amplified by a dual audio op amp before they are presented to the audio switch.

Figure 2 shows a matching audio switch for the MAX9656. Similar to how the MAX9656 handles video signals, the audio signals from the set-top box chip or the audio signals from the TV SCART are routed to the VCR SCART.

### AC-Coupling the Outputs

The outputs can be AC-coupled since the output stage can source and sink current as shown in Figure 3. Coupling capacitors should be 220 $\mu$ F or greater to keep the highpass filter, formed by the 150 $\Omega$  equivalent resistance of the video transmission line, to a corner frequency of 4.8Hz or below. The frame rate of PAL systems is 25Hz. The corner frequency should be well below the frame rate.

# Low-Power Video Switches for Dual SCART Connectors

MAX9655/MAX9656

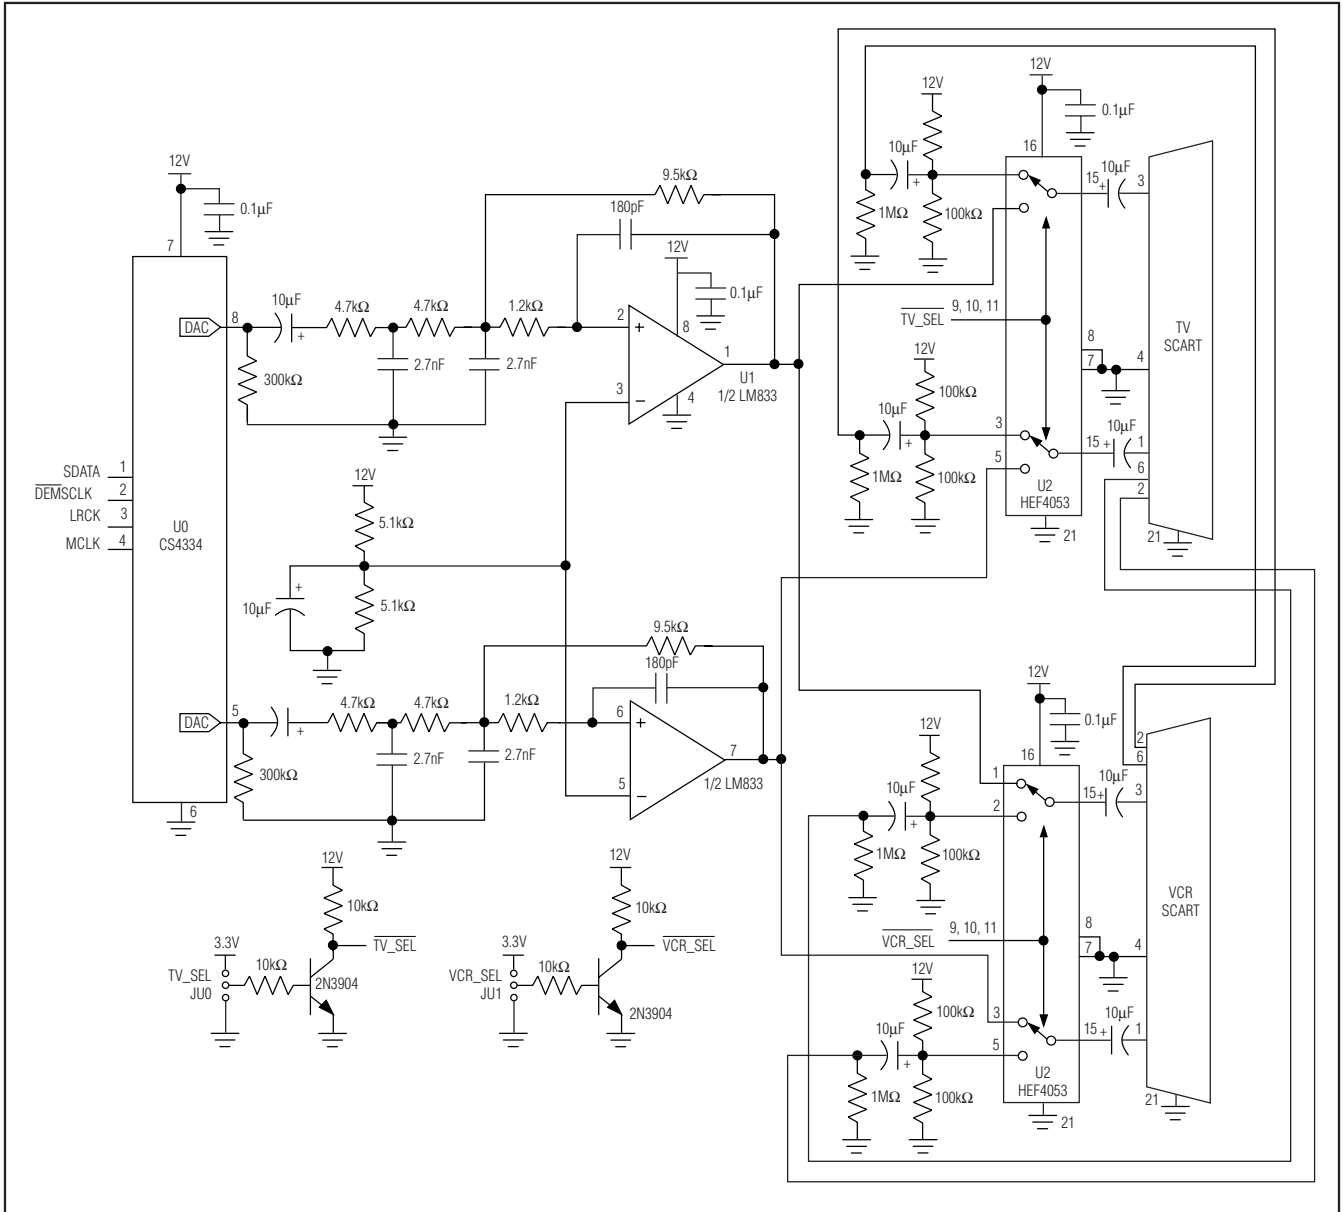

Figure 2. Audio Switch for the MAX9656

# Low-Power Video Switches for Dual SCART Connectors

**Table 6. Quiescent and Average Power Consumption for MAX9655/MAX9656**

MEASUREMENTS	POWER CONSUMPTION (mW)	CONDITIONS
Quiescent Power Consumption	69	No load.
Average Power Consumption	175	150Ω to ground on each output. 50% flat field signal on each input.

### Power Consumption

The quiescent power consumption and average power consumption of the MAX9655/MAX9656 are very low because of the 3.3V operation and low-power circuit design. Quiescent power consumption is defined when the MAX9655/MAX9656 are operating without loads and without any video signals.

Average power consumption represents the normal power consumption when the devices drive real video signals into real video loads. It is measured when the MAX9655/MAX9656 drive a 150Ω load to ground with a 50% flat field, which serves as a proxy for a real video signal.

Table 6 shows the quiescent and average power consumption of the MAX9655/MAX9656.

### Power-Supply Bypassing and Ground

The MAX9655/MAX9656 operate from a single-supply voltage down to 2.7V, allowing for low-power operation. Bypass  $V_{DD}$  to GND with a 0.1μF capacitor. Place all external components as close as possible to the device.
