TENTATIVE   TOSHIBA MOS DIGITAL INTEGRATED CIRCUIT SILICON GATE CMOS

2-GBIT (256 M × 8 BITS) CMOS NAND E^{2}PROM

DESCRIPTION

The TC58NVG1S3C is a single 3.3 V 2-Gbit (2,214,592,512 bits) NAND Electrically Erasable and Programmable Read-Only Memory (NAND E^{2}PROM) organized as (2048 + 64) bytes × 64 pages × 2048 blocks.
The device has two 2112-byte static registers which allow program and read data to be transferred between the register and the memory cell array in 2112-byte increments. The Erase operation is implemented in a single block unit (128 Kbytes + 4Kbytes: 2112 bytes × 64 pages).

The TC58NVG1S3C is a serial-type memory device which utilizes the I/O pins for both address and data input/output as well as for command inputs. The Erase and Program operations are automatically executed making the device most suitable for applications such as solid-state file storage, voice recording, image file memory for still cameras and other systems which require high-density non-volatile memory data storage.

FEATURES

- Organization

	TC58NVG1S3C
Memory cell array	2112 × 128K × 8
Register	2112 × 8
Page size	2112 bytes
Block size	(128K + 4K) bytes

- Modes

  Read, Reset, Auto Page Program, Auto Block Erase, Status Read, Page Copy,
  Multi Page Program, Multi Block Erase, Multi Page Copy, Multi Page Read

- Mode control
    Serial input/output
    Command control

- Number of valid blocks
    Min 2008 blocks
    Max 2048 blocks
- Power supply
    V_{CC} = 2.7V to 3.6V

- Access time
Cell array to register	30 μs max
Serial Read Cycle	50 ns min

- Program/Erase time
Auto Page Program	300 μs/page typ.
Auto Block Erase	2.5 ms/block typ.

- Operating current
Read (50 ns cycle)	30mA max
Program (avg.)	30mA max
Erase (avg.)	30mA max
Standby	50 μA max

- Package
TC58NVG1S3CTA00	TSOP I 48-P-1220-0.50
(Weight: 0.53 g typ.)

(*1) t_{PROG}: Since the last page programming by 10h command is initiated after the previous cache program, the t_{PROG} during cache programming is given by the following equation.

t_{PROG} = t_{PROG} of the last page + t_{PROG} of the previous page − A
A = (command input cycle + address input cycle + data input cycle time of the last page)

If "A" exceeds the t_{PROG} of previous page, t_{PROG} of the last page is t_{PROG} max.

(Note)   Make sure to terminate the operation with 80h to 10h command sequence.
If the operation is terminated by 80h to 15h command sequence, monitor I/O 6 (Ready / Busy) by issuing Status Read command (70h) and make sure the previous page program operation is completed. If the page program operation is completed issue FFh reset before next operation.

(*1) t_{PROG}: Since the last page programming by 10h command is initiated after the previous cache program, the t_{PROG} during cache programming is given by the following equation.

$t_{PROG} = t_{PROG}$ of the last page + t_{PROG} of the previous page − A
A = (command input cycle + address input cycle + data input cycle time of the last page)

If "A" exceeds the t_{PROG} of previous page, t_{PROG} of the last page is t_{PROG} max.
(Note)   Make sure to terminate the operation with 80h to 10h command sequence.
If the operation is terminated by 80h to 15h command sequence, monitor I/O6 (Ready / Busy) by issuing Status Read command (70h) and make sure the previous page program operation is completed. If the page program operation is completed issue FFh reset before next operation.

PIN FUNCTIONS

The device is a serial access memory which utilizes time-sharing input of address information.

Command Latch Enable: CLE

The CLE input signal is used to control loading of the operation mode command into the internal command register. The command is latched into the command register from the I/O port on the rising edge of the $\overline{\text{WE}}$ signal while CLE is High.

Address Latch Enable: ALE

The ALE signal is used to control loading address information into the internal address register. Address information is latched into the address register from the I/O port on the rising edge of $\overline{\text{WE}}$ while ALE is High.

Chip Enable: $\overline{\text{CE}}$

The device goes into a low-power Standby mode when $\overline{\text{CE}}$ goes High during the device is in Ready state. The $\overline{\text{CE}}$ signal is ignored when device is in Busy state ($\text{RY}/\overline{\text{BY}}$ = L), such as during a Program or Erase or Read operation, and will not enter Standby mode even if the $\overline{\text{CE}}$ input goes High.

Write Enable: $\overline{\text{WE}}$

The $\overline{\text{WE}}$ signal is used to control the acquisition of data from the I/O port.

Read Enable: $\overline{\text{RE}}$

The $\overline{\text{RE}}$ signal controls serial data output. Data is available t_{REA} after the falling edge of $\overline{\text{RE}}$.
The internal column address counter is also incremented (Address = Address + l) on this falling edge.

I/O Port: I/O1 to 8

The I/O1 to 8 pins are used as a port for transferring address, command and input/output data to and from the device.

Write Protect: $\overline{\text{WP}}$

The $\overline{\text{WP}}$ signal is used to protect the device from accidental programming or erasing. The internal voltage regulator is reset when $\overline{\text{WP}}$ is Low. This signal is usually used for protecting the data during the power-on/off sequence when input signals are invalid.

Ready/Busy: $\text{RY}/\overline{\text{BY}}$

The $\text{RY}/\overline{\text{BY}}$ output signal is used to indicate the operating condition of the device. The $\text{RY}/\overline{\text{BY}}$ signal is in Busy state ($\text{RY}/\overline{\text{BY}}$ = L) during the Program, Erase and Read operations and will return to Ready state ($\text{RY}/\overline{\text{BY}}$ = H) after completion of the operation. The output buffer for this signal is an open drain and has to be pulled-up to Vccq with an appropriate resister.

Schematic Cell Layout and Address Assignment

The Program operation works on page units while the Erase operation works on block units.
A page consists of 2112 bytes in which 2048 bytes are used for main memory storage and 64 bytes are for redundancy or for other uses.

1 page = 2112 bytes
1 block = 2112 bytes × 64 pages = (128K + 4K) bytes
Capacity = 2112 bytes × 64 pages × 2048 blocks

Table 1. Addressing

	I/O8	I/O7	I/O6	I/O5	I/O4	I/O3	I/O2	I/O1

PA0 to PA5: NAND address in block

Operation Mode: Logic and Command Tables

The operation modes such as Program, Erase, Read and Reset are controlled by command operations shown in Table 3. Address input, command input and data input/output are controlled by the CLE, ALE, $\overline{CE}$, $\overline{WE}$, $\overline{RE}$ and $\overline{WP}$ signals, as shown in Table 2.

Table 2. Logic Table

	CLE	ALE	$\overline{CE}$	$\overline{WE}$	$\overline{RE}$	$\overline{WP}$ [*1]

DEVICE OPERATION

Read Mode

Read mode is set when the "00h" and "30h" commands are issued to the Command register. Between the two commands, a start address for the Read mode needs to be issued. Refer to the figures below for the sequence and the block diagram (Refer to the detailed timing chart.).

A data transfer operation from the cell array to the Data Cache via Page Buffer starts on the rising edge of $\overline{WE}$ in the 30h command input cycle (after the address information has been latched). The device will be in the Busy state during this transfer period.

After the transfer period, the device returns to Ready state. Serial data can be output synchronously with the $\overline{RE}$ clock from the start address designated in the address input cycle.

Random Column Address Change in Read Cycle

During the serial data output from the Data Cache, the column address can be changed by inputting a new column address using the 05h and E0h commands. The data is read out in serial starting at the new column address. Random Column Address Change operation can be done multiple times within the same page.

Read Operation with Read Cache

The device has a Read operation with Data Cache that enables the high speed read operation shown below. When the block address changes, this sequence has to be started from the beginning.
If the 31h command is issued to the device, the data content of the next page is transferred to the Page Buffer during serial data out from the Data Cache, and therefore the tR (Data transfer from memory cell to data register) will be reduced.

1   Normal read. Data is transferred from Page N to Data Cache through Page Buffer. During this time period, the device outputs Busy state for tR max.

2   After the Ready/Busy returns to Ready, 31h command is issued and data is transferred to Data Cache from Page Buffer again. This data transfer takes tDCBSYR1 max and the completion of this time period can be detected by Ready/Busy signal.

3   Data of Page N + 1 is transferred to Page Buffer from cell while the data of Page N in Data cache can be read out by /RE clock simultaneously.

4   The 31h command makes data of Page N + 1 transfer to Data Cache from Page Buffer after the completion of the transfer from cell to Page Buffer. The device outputs Busy state for tDCBSYR1 max.. This Busy period depends on the combination of the internal data transfer time from cell to Page buffer and the serial data out time.

5   Data of Page N + 2 is transferred to Page Buffer from cell while the data of Page N + 1 in Data cache can be read out by /RE clock simultaneously

6   The 3Fh command makes the data of Page N + 2 transfer to the Data Cache from the Page Buffer after the completion of the transfer from cell to Page Buffer. The device outputs Busy state for tDCBSYR1 max.. This Busy period depends on the combination of the internal data transfer time from cell to Page buffer and the serial data out time.

7   Data of Page N + 2 in Data Cache can be read out, but since the 3Fh command does not transfer the data from the memory cell to Page Buffer, the device can accept new command input immediately after the completion of serial data out.
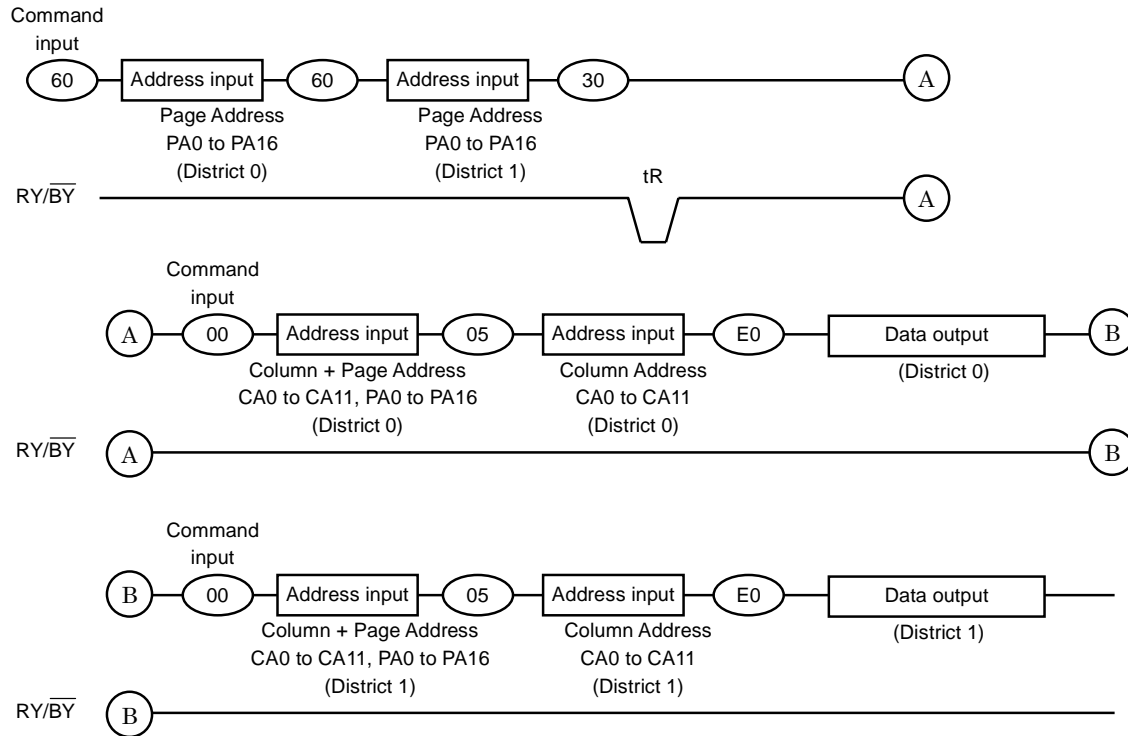

Multi Page Read Operation

The device has a Multi Page Read operation and Multi Page Read with Data Cache operation..

(1) Multi Page Read without Data Cache
The sequence of command and address input is shown below.
Same page address (PA0 to PA5) within each district has to be selected.

Command
input

(60) → [Address input] → (60) → [Address input] → (30) ──────── (A)

Reading

Selected
page

Selected
page

The data transfer operation from the cell array to the Data Cache via Page Buffer starts on the rising edge of W̄Ē in the 30h command input cycle (after the 2 Districts address information has been latched). The device will be in the Busy state during this transfer period.

After the transfer period, the device returns to Ready state. Serial data can be output synchronously with the R̄Ē clock from the start address designated in the address input cycle.

(2) Multi Page Read with Data Cache

When the block address changes (increments) this sequenced has to be started from the beginning.

The sequence of command and address input is shown below.

Same page address (PA0 to PA5) within each district has to be selected.
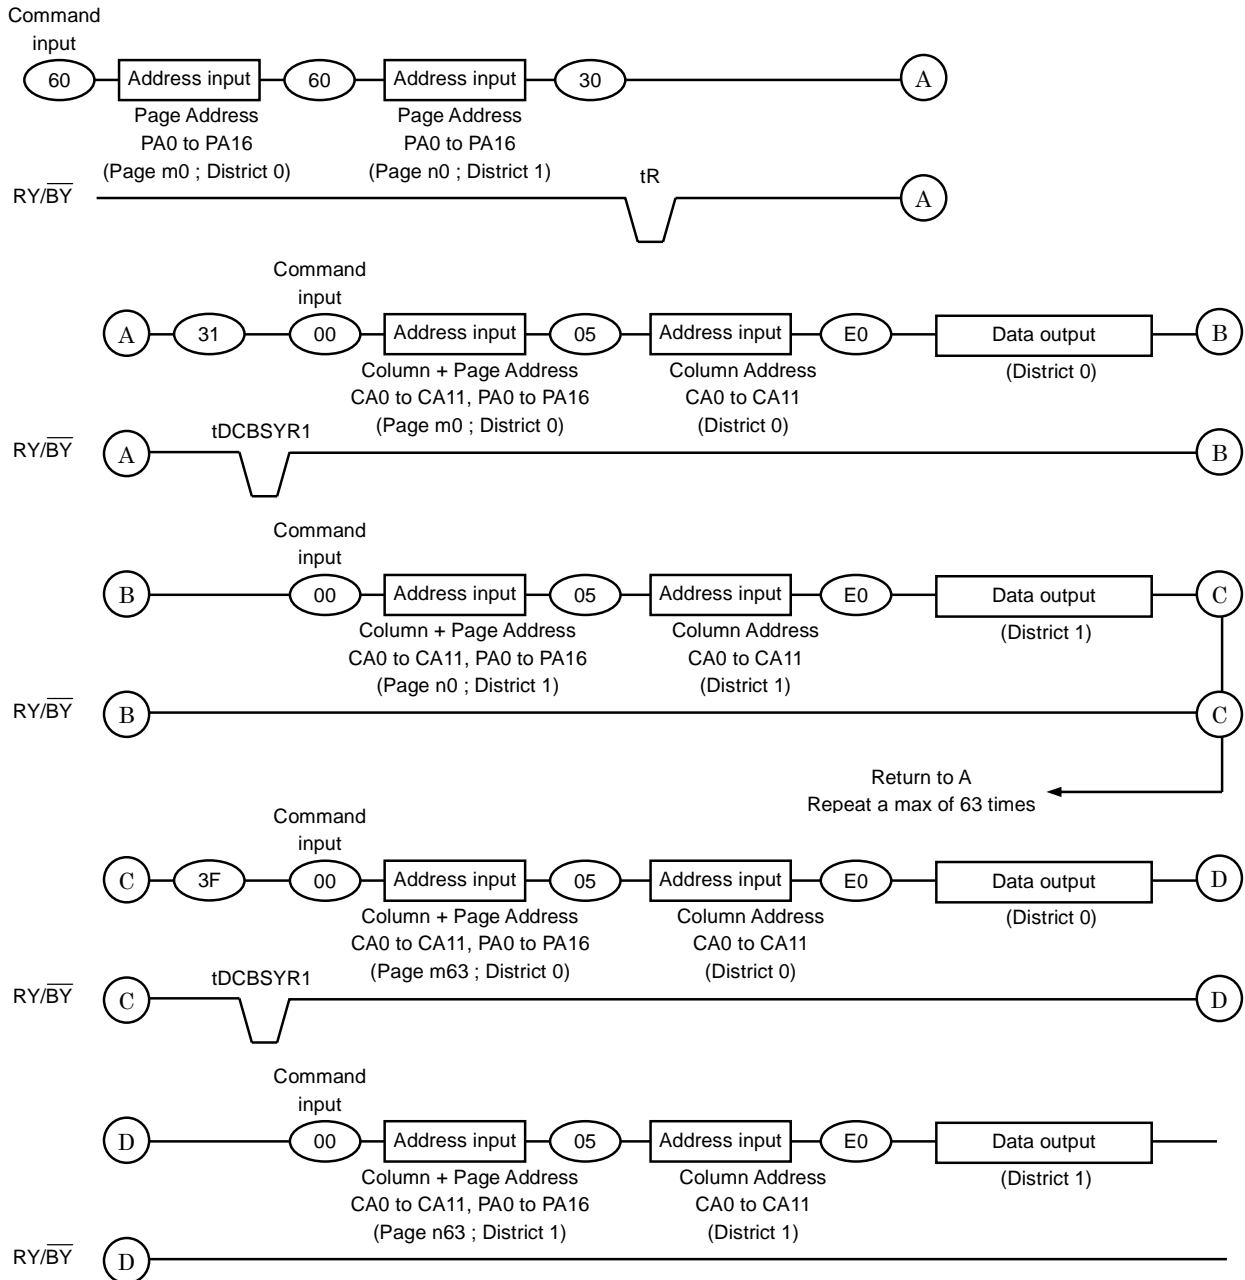

(3) Notes

    (a) Internal addressing in relation with the Districts

      To use Multi Page Read operation, the internal addressing should be considered in relation with the District.
- The device consists from 2 Districts.
- Each District consists from 1024 erase blocks.
- The allocation rule is follows.
  - District 0: Block 0, Block 1, Block 2, Block 3, ···, Block 1023
  - District 1: Block 1024, Block 1025, Block 1026, Block 1027, ···, Block 2047

    (b) Address input restriction for the Multi Page Read operation

      There are following restrictions in using Multi Page Read;

(Restriction)
Maximum one block should be selected from each District.
Same page address (PA0 to PA5) within two districts has to be selected.
For example;
(60) [District 0, Page Address 0x00000]   (60) [District 1, Page Address 0x10000] (30)
(60) [District 0, Page Address 0x00001]   (60) [District 1, Page Address 0x10001] (30)

(Acceptance)
There is no order limitation of the District for the address input.
For example, following operation is accepted;
(60) [District 0]   (60) [District 1] (30)
(60) [District 1]   (60) [District 0] (30)

It requires no mutual address relation between the selected blocks from each District.

    (c) $\overline{\text{WP}}$ signal
     Make sure $\overline{\text{WP}}$ is held to High level when Multi Page Read operation is performed

Auto Page Program Operation

The device carries out an Automatic Page Program operation when it receives a "10h" Program command after the address and data have been input. The sequence of command, address and data input is shown below. (Refer to the detailed timing chart.)

The data is transferred (programmed) from the Data Cache via the Page Buffer to the selected page on the rising edge of $\overline{WE}$ following input of the "10h" command. After programming, the programmed data is transferred back to the Page Buffer to be automatically verified by the device. If the programming does not succeed, the Program/Verify operation is repeated by the device until success is achieved or until the maximum loop number set in the device is reached.

Random Column Address Change in Auto Page Program Operation

The column address can be changed by the 85h command during the data input sequence of the Auto Page Program operation.

Two address input cycles after the 85h command are recognized as a new column address for the data input. After the new data is input to the new column address, the 10h command initiates the actual data program into the selected page automatically. The Random Column Address Change operation can be repeated multiple times within the same page.
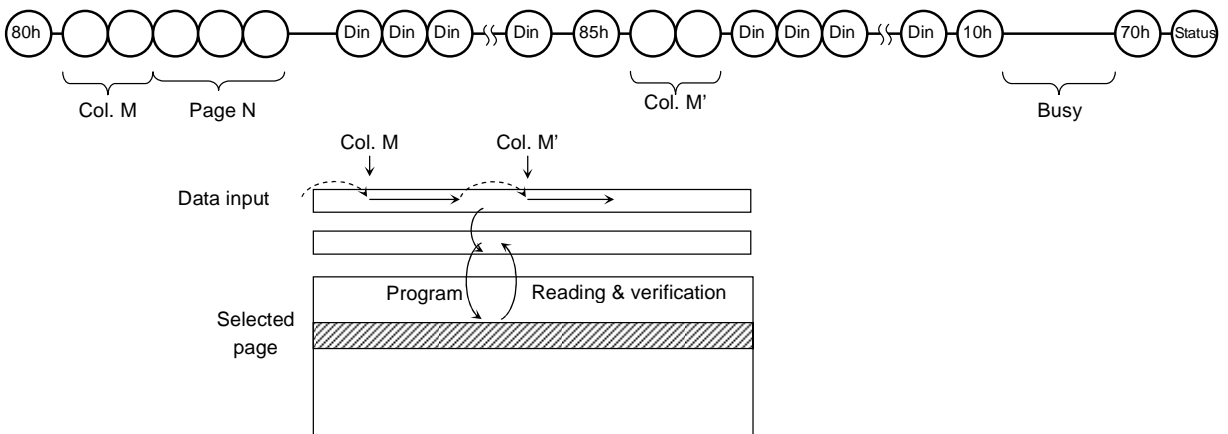

Auto Page Program Operation with Data Cache

The device has an Auto Page Program with Data Cache operation enabling the high speed program operation shown below. When the block address changes this sequenced has to be started from the beginning.
Issuing the 15h command to the device after serial data input initiates the program operation with Data Cache

1   Data for Page N is input to Data Cache.

2   Data is transferred to the Page Buffer by the 15h command. During the transfer the Ready/Busy outputs Busy State ($t_{DCBSYW2}$).

3   Data is programmed to the selected page while the data for page N + 1 is input to the Data Cache.

4   By the 15h command, the data in the Data Cache is transferred to the Page Buffer after the programming of page N is completed. The device output busy state from the 15h command until the Data Cache becomes empty. The duration of this period depends on timing between the internal programming of page N and serial data input for Page N + 1 ($t_{DCBSYW2}$).

5   Data for Page N + P is input to the Data Cache while the data of the Page N + P − 1 is being programmed.

6   The programming with Data Cache is terminated by the 10h command. When the device becomes Ready, it shows that the internal programming of the Page N + P is completed.

NOTE: Since the last page programming by the 10h command is initiated after the previous cache program, the tPROG during cache programming is given by the following;

t_{PROG} = t_{PROG} for the last page + t_{PROG} of the previous page − (command input cycle + address input cycle + data input cycle time of the last page)

Pass/fail status for each page programmed by the Auto Page Programming with Data Cache operation can be detected by the Status Read operation.

- I/O1 : Pass/fail of the current page program operation.
- I/O2 : Pass/fail of the previous page program operation.

The Pass/Fail status on I/O1 and I/O2 are valid under the following conditions.

- Status on I/O1: Page Buffer Ready/Busy is Ready State.
  The Page Buffer Ready/Busy is output on I/O6 by Status Read operation or RY/$\overline{BY}$ pin after the 10h command
- Status on I/O2: Data Cache Read/Busy is Ready State.
  The Data Cache Ready/Busy is output on I/O7 by Status Read operation or RY/$\overline{BY}$ pin after the 15h command.

Example)
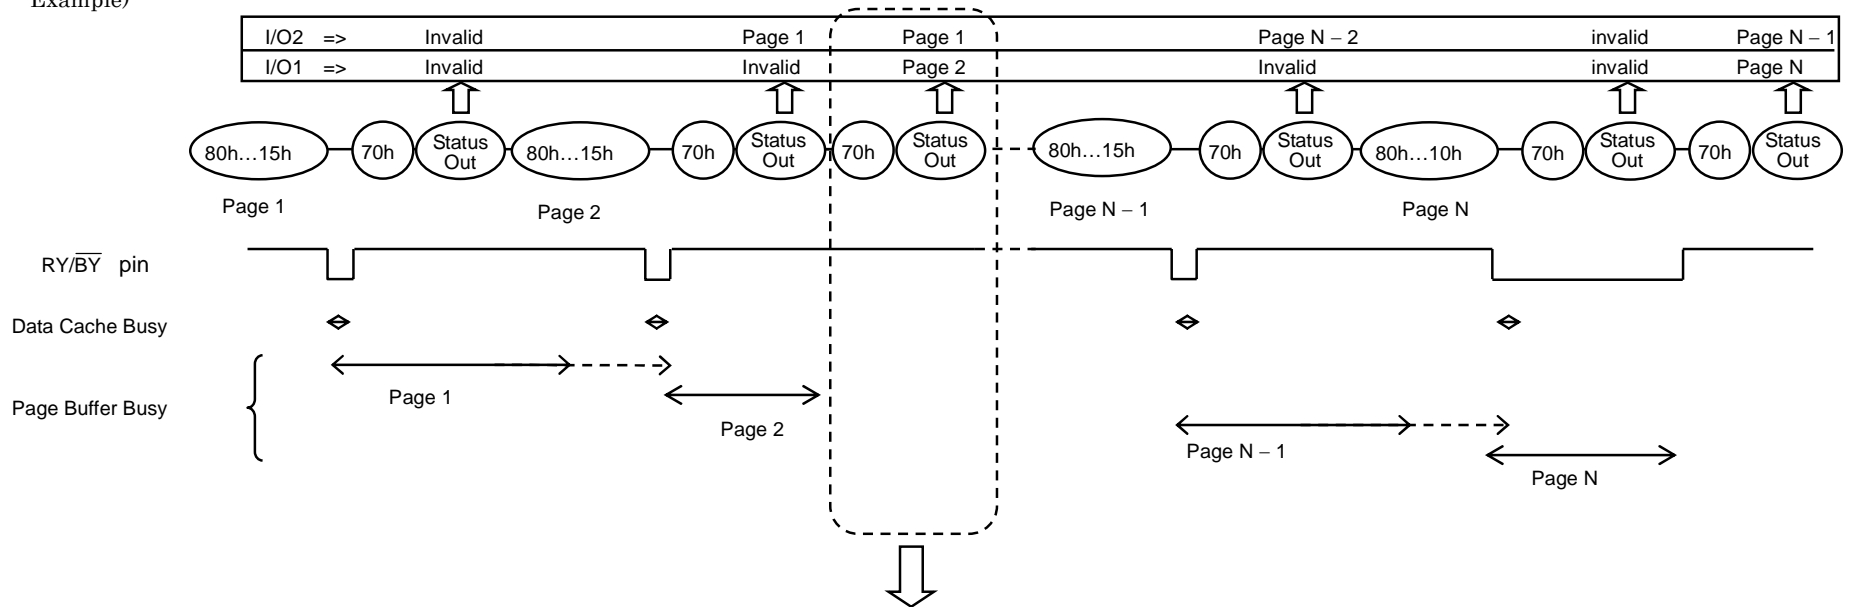

If the Page Buffer Busy returns to Ready before the next 80h command input, and if Status Read is done during this Ready period, the Status Read provides pass/fail for Page 2 on I/O1 and pass/fail result for Page1 on I/O2

Multi Page Program with Data Cache

The device has a Multi Page Program with Data Cache operation, which enables even higher speed program operation compared to Auto Page Program with Data Cache as shown below. When the block address changes (increments) this sequenced has to be started from the beginning.

The sequence of command, address and data input is shown below. (Refer to the detailed timing chart.)
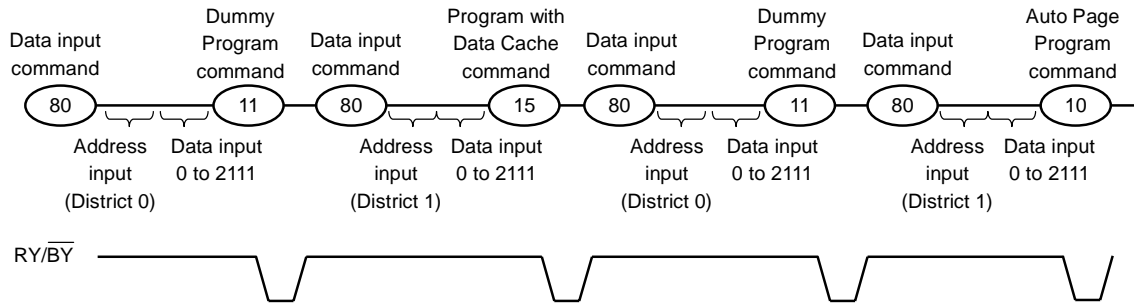

After "15h" or "10h" Program command is input to device, physical programing starts as follows. For details of Auto Program with Data Cache, refer to "Auto Page Program with Data Cache".
The data is transferred (programmed) from the page buffer to the selected page on the rising edge of -WE following input of the "15h" or "10h" command. After programming, the programmed data is transferred back to the register to be automatically verified by the device. If the programming does not succeed, the Program/Verify operation is repeated by the device until success is achieved or until the maximum loop number set in the device is reached.

Starting the above operation from 1st page of the selected erase blocks, and then repeating the operation total 64 times with incrementing the page address in the blocks, and then input the last page data of the blocks, "10h" command executes final programming. Make sure to be terminated with 80h-10h- command sequence.

In this full sequence, the command sequence is following.
After the "15h" or "10h" command, the results of the above operation is shown through the "71h"Status Read command.
The 71h command Status description is as below.

	STATUS	OUTPUT	
I/O1	Chip Status1 : Pass/Fail	Pass: 0	Fail: 1
I/O2	District 0 Chip Status1 : Pass/Fail	Pass: 0	Fail: 1
I/O3	District 1 Chip Status1 : Pass/Fail	Pass: 0	Fail: 1
I/O4	District 0 Chip Status2 : Pass/Fail	Pass: 0	Fail: 1
I/O5	District 1 Chip Status2 : Pass/Fail	Pass: 0	Fail: 1
I/O6	Ready/Busy	Ready: 1	Busy: 0
I/O7	Data Cache Ready/Busy	Ready: 1	Busy: 0
I/O8	Write Protect	Protect: 0	Not Protect: 1

I/O1 describes Pass/Fail condition of district 0 and 1(OR data of I/O2 and I/O3). If one of the districts fails during multi page program operation, it shows "Fail".

I/O2 to 5 shows the Pass/Fail condition of each district. For details on "Chip Status1" and "Chip Status2", refer to section "Status Read".

Internal addressing in relation with the Districts

To use Multi Page Program operation, the internal addressing should be considered in relation with the District.

- The device consists of 2 Districts.
- Each District has 1024 erase blocks.
- The allocation rule is follows.

District 0: Block 0, Block 1, Block 2, Block 3, ⋯, Block 1023
District 1: Block 1024, Block 1025, Block 1026, Block 1027, ⋯, Block 2047

Address input restriction for the Multi Page Program with Data Cache operation

There are following restrictions in using Multi Page Program with Data Cache;

(Restriction)
Maximum one block should be selected from each District.
Same page address (PA0 to PA5) within two districts has to be selected.
For example;
(80) [District 0, Page Address 0x00000] (11)   (80) [District 1, Page Address 0x10000] (15 or 10)
(80) [District 0, Page Address 0x00001] (11)   (80) [District 1, Page Address 0x10001] (15 or 10)

(Acceptance)
There is no order limitation of the District for the address input.
For example, following operation is accepted;
(80) [District 0] (11)   (80) [District 1] (15 or 10)
(80) [District 1] (11)   (80) [District 0] (15 or 10)

It requires no mutual address relation between the selected blocks from each District.

Operating restriction during the Multi Page Program with Data Cache operation

(Restriction)
The operation has to be terminated with "10h" command.
Once the operation is started, no commands other than the commands shown in the timing diagram is allowed to be input except for Status Read command and reset command.

Page Copy (2)

By using Page Copy (2), data in a page can be copied to another page after the data has been read out.
When the block address changes (increments) this sequenced has to be started from the beginning.
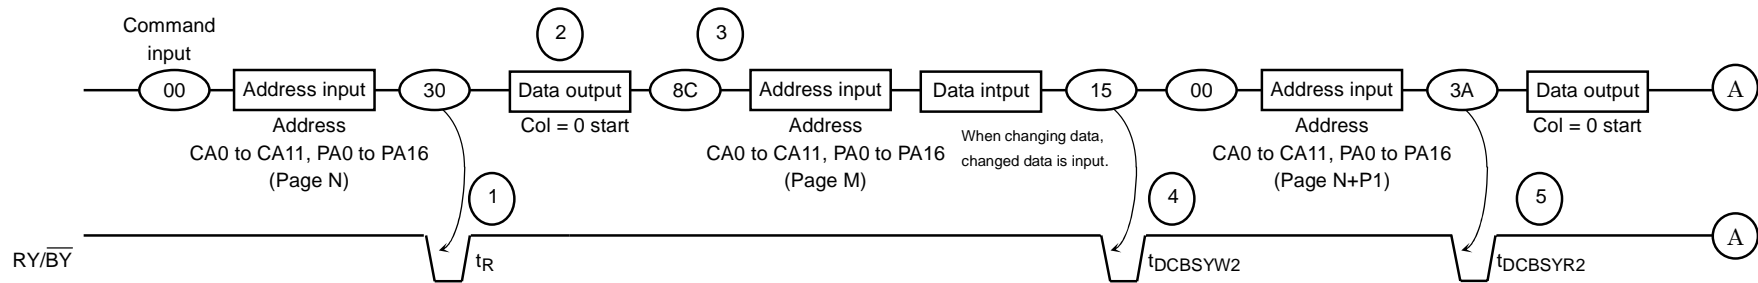

Page Copy (2) operation is as following.

1 Data for Page N is transferred to the Data Cache.

2 Data for Page N is read out.

3 Copy Page address M is input and if the data needs to be changed, changed data is input.

4 Data Cache for Page M is transferred to the Page Buffer.

5 After the Ready state, Data for Page N + P1 is output from the Data Cache while the data of Page M is being programmed.

Command input

Cell Array

Page M
Page N + P1

Page M + R1
Page N + P2

Page M + Rn − 1

Page M + Rn − 1
Page N + Pn

6   Copy Page address (M + R1) is input and if the data needs to be changed, changed data is input.

7   After programming of page M is completed, Data Cache for Page M + R1 is transferred to the Page Buffer.

8   By the 15h command, the data in the Page Buffer is programmed to Page M + R1. Data for Page N + P2 is transferred to the Data cache.

9   The data in the Page Buffer is programmed to Page M + Rn − 1. Data for Page N + Pn is transferred to the Data Cache.
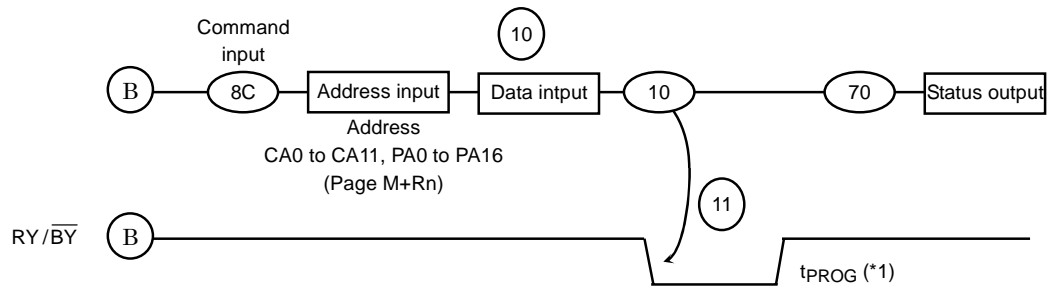

10　Copy Page address (M + Rn) is input and if the data needs to be changed, changed data is input.
11　By issuing the 10h command, the data in the Page Buffer is programmed to Page M + Rn.

(*1) Since the last page programming by the 10h command is initiated after the previous cache program, the t_{PROG} here will be expected as the following,

t_{PROG} = tPROG of the last page + tPROG of the previous page − (command input cycle + address input cycle + data output/input cycle time of the last page)

NOTE) This operation needs to be executed within District-0 (Block 0 − 1023) or District-1 (Block 1024 − 2047).

Data input is required only if previous data output needs to be altered.
If the data has to be changed, locate the desired address with the column and page address input after the 8Ch command, and change only the data that needs be changed.
If the data does not have to be changed, data input cycles are not required.

Make sure $\overline{WP}$ is held to High level when Page Copy (2) operation is performed.
Also make sure the Page Copy operation is terminated with 8Ch-10h command sequence

Multi Page Copy (2)

By using Multi Page Copy (2), data in two pages can be copied to another pages after the data has been read out.

When the each block address changes (increments) this sequenced has to be started from the beginning.
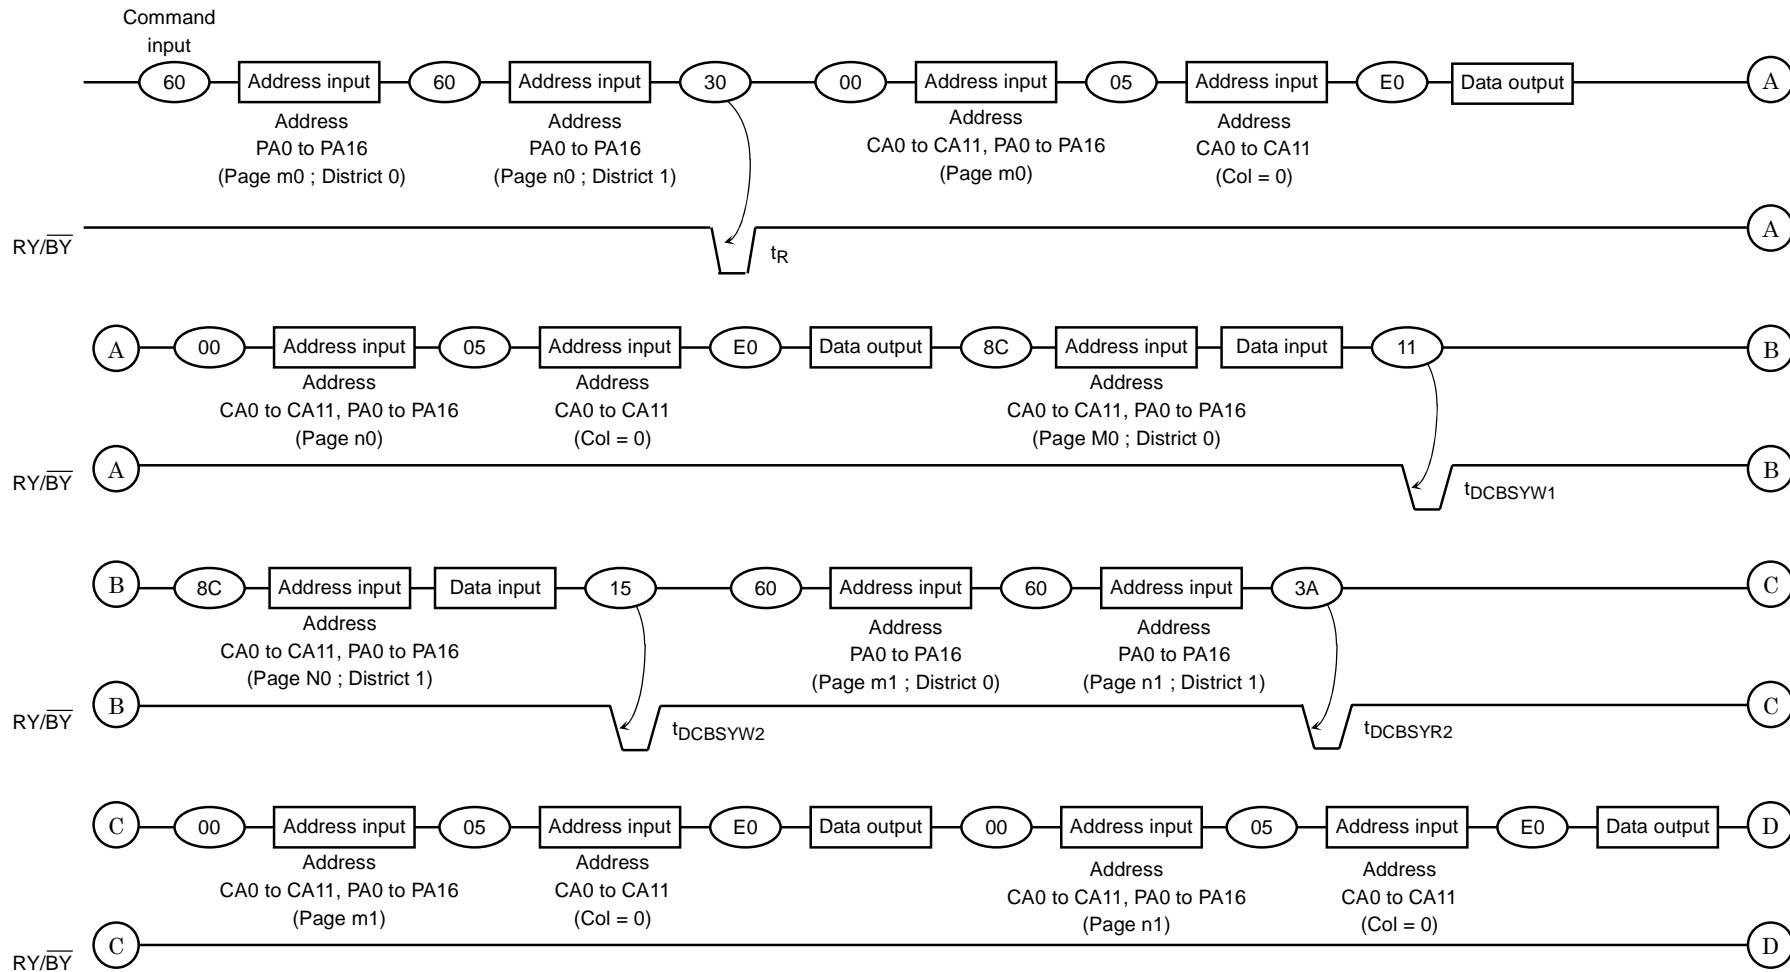

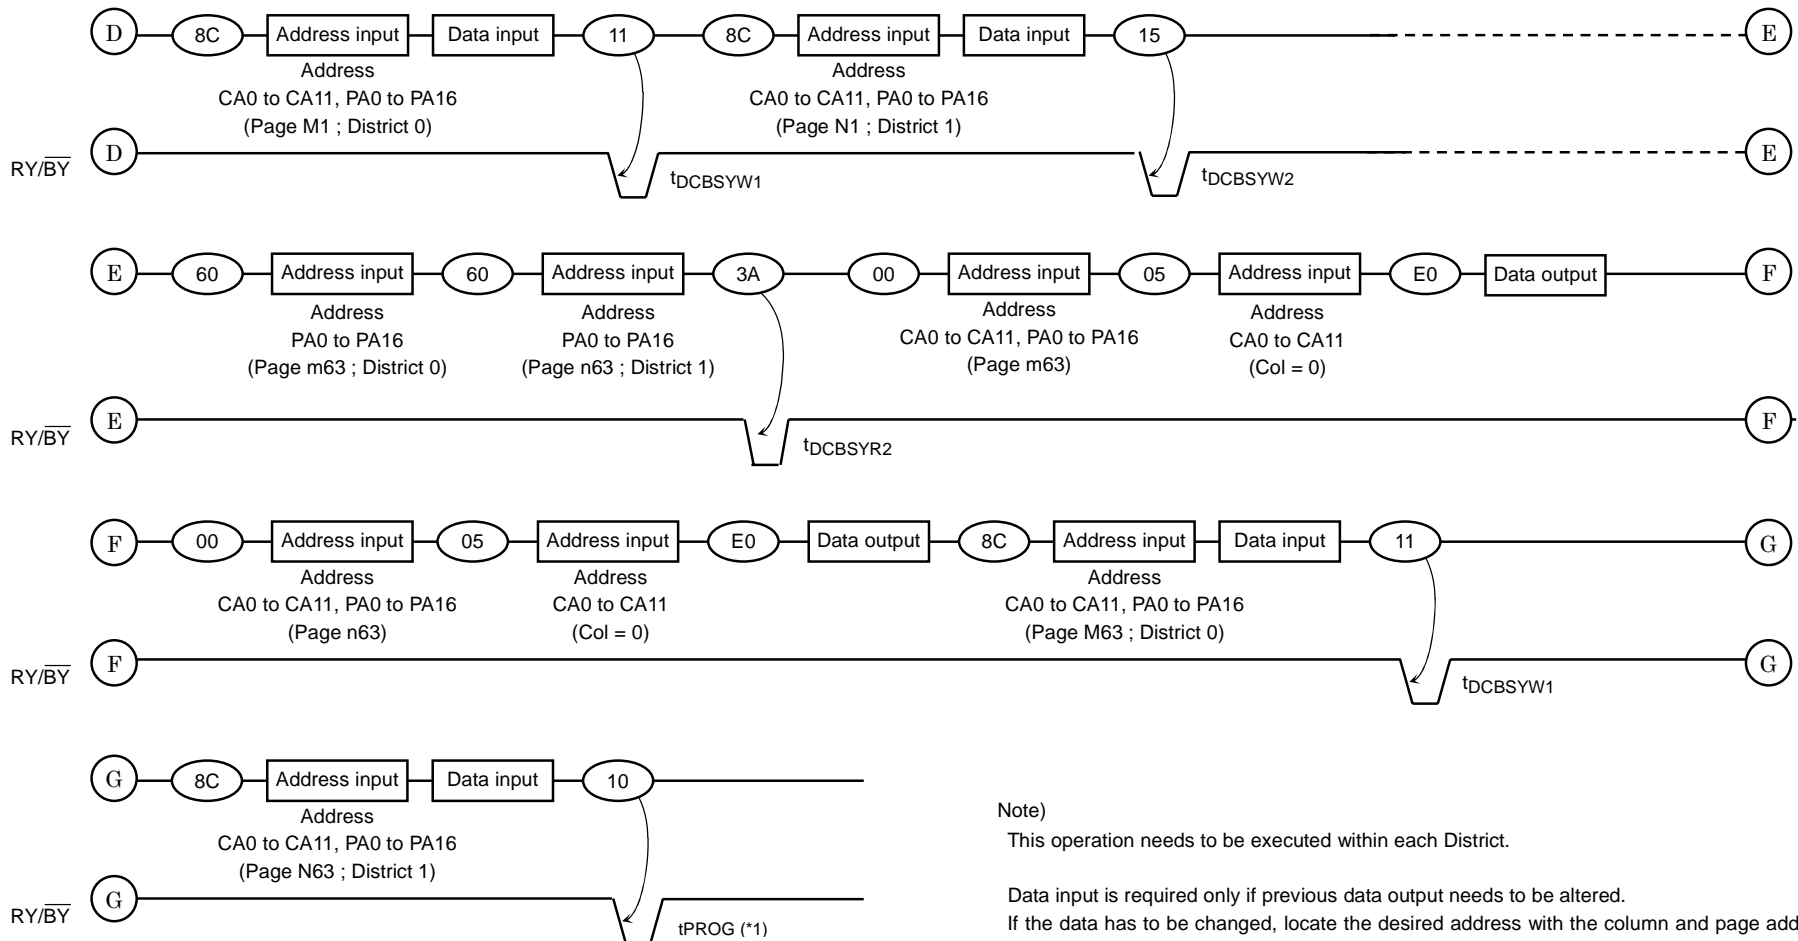

Same page address (PA0 to PA5) within two districts has to be selected.

t_{PROG} (*1)

Note)
This operation needs to be executed within each District.

Data input is required only if previous data output needs to be altered.
If the data has to be changed, locate the desired address with the column and page address input after the 8Ch command, and change only the data that needs be changed.
If the data does not have to be changed, data input cycles are not required.

Make sure $\overline{WP}$ is held to High level when Multi Page Copy (2) operation is performed.
Also make sure the Multi Page Copy operation is terminated with 8Ch-10h command sequence

(*1) t_{PROG}: Since the last page programming by 10h command is initiated after the previous cache program, the t_{PROG} during cache programming is given by the following equation.

t_{PROG} = t_{PROG} of the last page + t_{PROG} of the previous page-A
A = (command input cycle + address input cycle + data output/input cycle time of the last page)
If "A" exceeds the t_{PROG} of previous page, t_{PROG} of the last page is t_{PROG} max.

Auto Block Erase

The Auto Block Erase operation starts on the rising edge of $\overline{WE}$ after the Erase Start command "D0h" which follows the Erase Setup command "60h". This two-cycle process for Erase operations acts as an extra layer of protection from accidental erasure of data due to external noise. The device automatically executes the Erase and Verify operations.

```
  60 ---{Block Address   D0 --------------   70 ------- I/O  Pass
         input: 3 cycles}  Erase Start        Status Read      Fail
                           command            command

RY/BY ‾‾‾‾‾‾‾‾‾‾‾‾‾‾‾_____Busy_____/‾‾‾‾‾‾‾‾‾‾
```

Multi Block Erase

The Multi Block Erase operation starts by selecting two block addresses before D0h command as in below diagram. The device automatically executes the Erase and Verify operations and the result can be monitored by checking the status by 71h status read command. For details on 71h status read command, refer to section "Multi Page Program with Data Cache".

```
  60 ---{Block Address}  60 ---{Block Address}  D0 -----   71 ------- I/O  Pass
         input: 3 cycles        input: 3 cycles   Erase Start  Status Read    Fail
         District 0             District 1        command      command

RY/BY ‾‾‾‾‾‾‾‾‾‾‾‾‾‾‾‾‾‾‾‾‾‾‾‾‾\_____Busy_____/‾‾‾‾‾‾
```

Internal addressing in relation with the Districts

To use Multi Block Erase operation, the internal addressing should be considered in relation with the District.
- The device consists from 2 Districts.
- Each District consists from 1024 erase blocks.
- The allocation rule is follows.
    District 0: Block 0, Block 1, Block 2, Block 3, ···, Block 1023
    District 1: Block 1024, Block 1025, Block 1026, Block 1027, ···, Block 2047

Address input restriction for the Multi Block Erase

There are following restrictions in using Multi Block Erase

(Restriction)
Maximum one block should be selected from each District.
For example;
(60) [District 0] (60) [District 1] (D0)

(Acceptance)
There is no order limitation of the District for the address input.
For example, following operation is accepted;
(60) [District 1] (60) [District 0] (D0)

It requires no mutual address relation between the selected blocks from each District.

Make sure to terminate the operation with D0h command. If the operation needs to be terminated before D0h command input, input the FFh reset command to terminate the operation.

ID Read

The device contains ID codes which can be used to identify the device type, the manufacturer, and features of the device. The ID codes can be read out under the following timing conditions:

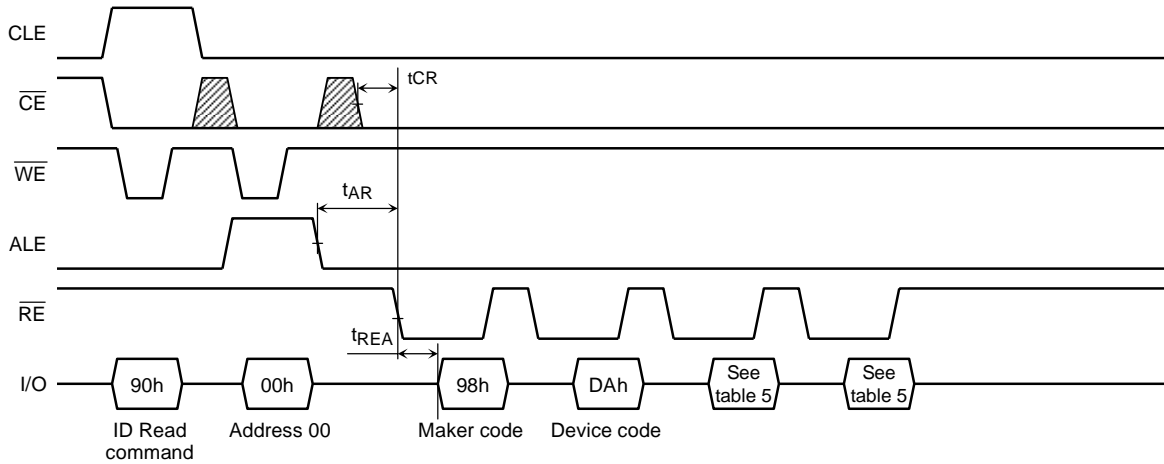

Table 5. Code table

		Description	I/O8	I/O7	I/O6	I/O5	I/O4	I/O3	I/O2	I/O1	Hex Data
1st Data	Manufacture Code		1	0	0	1	1	0	0	0	98h
2nd Data	Device Code		1	1	0	1	1	0	1	0	DAh
3rd Data	Chip Number, Cell Type		—	—	—	—	—	—	—	—	See table
4th Data	Page Size, Block Size, Redundant Size, Organization		—	—	—	—	—	—	—	—	See table

3rd Data

		Description	I/O8	I/O7	I/O6	I/O5	I/O4	I/O3	I/O2	I/O1
Internal Chip Number		1 2 4 8							0 0 1 1	0 1 0 1
Cell Type		2 level cell 4 level cell 8 level cell 16 level cell					0 0 1 1	0 1 0 1		
Reserved			0 or 1	0	0 or 1	0 or 1				

4th Data

	Description	I/O8	I/O7	I/O6	I/O5	I/O4	I/O3	I/O2	I/O1
Page Size (without redundant area)	1 KB 2 KB 4 KB 8 KB							0 0 1 1	0 1 0 1
Block Size (without redundant area)	64 KB 128 KB 256 KB 512 KB			0 0 1 1	0 1 0 1				
Redundant area size (byte/512byte)	8 16 Reserved Reserved					0 0 1 1	0 1 0 1		
Organization	×8 ×16		0 1						
Reserved		0 or 1							

Status Read

The device automatically implements the execution and verification of the Program and Erase operations. The Status Read function is used to monitor the Ready/Busy status of the device, determine the result (pass /fail) of a Program or Erase operation, and determine whether the device is in Protect mode. The device status is output via the I/O port using $\overline{RE}$ after a "70h" command input. The Status Read can also be used during a Read operation to find out the Ready/Busy status.

The resulting information is outlined in Table 6.

Table 6. Status output table

	Definition	Page Program Block Erase	Cache Program	Read Cache Read
I/O1	Chip Status1 Pass: 0 Fail: 1	Pass/Fail	Pass/Fail	Invalid
I/O2	Chip Status 2 Pass: 0 Fail: 1	Invalid	Pass/Fail	Invalid
I/O3	Not Used	0	0	0
I/O4	Not Used	0	0	0
I/O5	Not Used	0	0	0
I/O6	Page Buffer Ready/Busy Ready: 1 Busy: 0	Ready/Busy	Ready/Busy	Ready/Busy
I/O7	Data Cache Ready/Busy Ready: 1 Busy: 0	Ready/Busy	Ready/Busy	Ready/Busy
I/O8	Write Protect Not Protected :1 Protected: 0	Write Protect	Write Protect	Write Protect

The Pass/Fail status on I/O1 and I/O2 is only valid during a Program/Erase operation when the device is in the Ready state.

Chip Status 1:

During an Auto Page Program or Auto Block Erase operation this bit indicates the pass/fail result.

During an Auto Page Programming with Data Cache operation, this bit shows the pass/fail results of the current page program operation, and therefore this bit is only valid when I/O6 shows the Ready state.

Chip Status 2:

This bit shows the pass/fail result of the previous page program operation during Auto Page Programming with Data Cache. This status is valid when I/O7 shows the Ready State.

The status output on the I/O6 is the same as that of I/O7 if the command input just before the 70h is not 15h or 31h.

An application example with multiple devices is shown in the figure below.
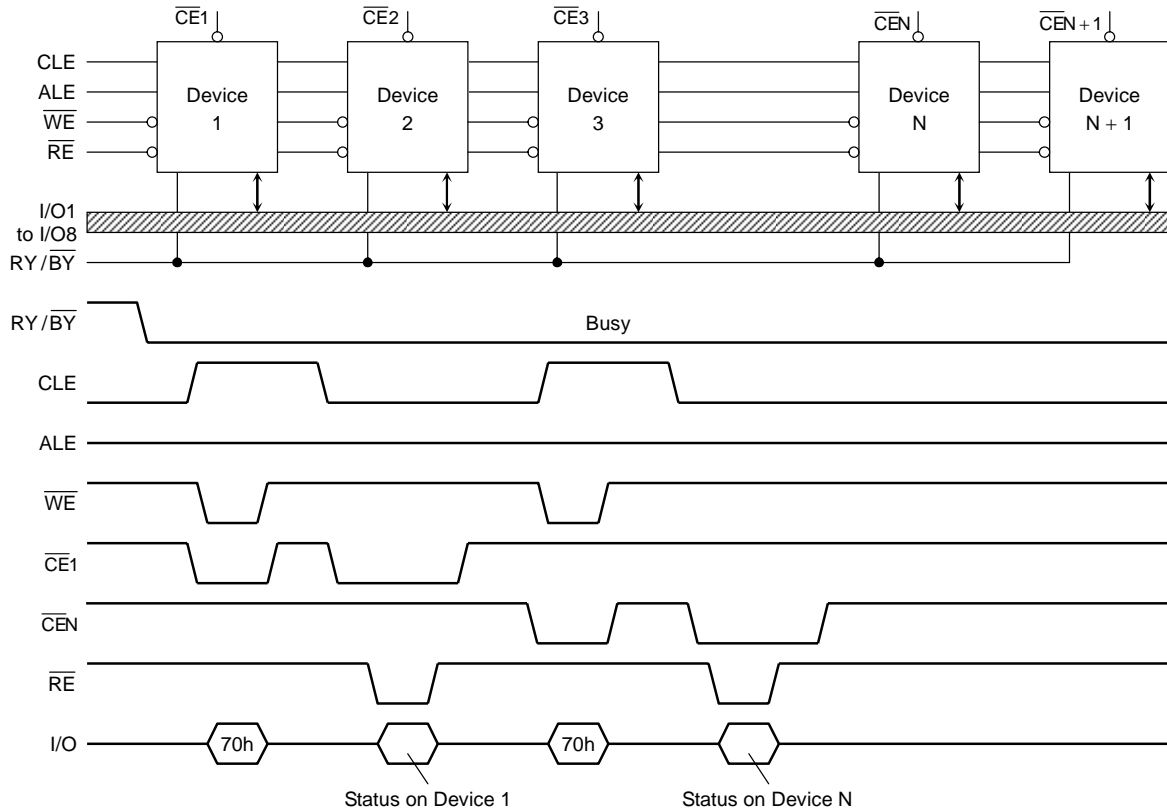

System Design Note: If the RY/$\overline{BY}$ pin signals from multiple devices are wired together as shown in the diagram, the Status Read function can be used to determine the status of each individual device.
Reset

The Reset mode stops all operations. For example, in case of a Program or Erase operation, the internally generated voltage is discharged to 0 volt and the device enters the Wait state.

Reset during a Cache Program/Page Copy may not just stop the most recent page program but it may also stop the previous program to a page depending on when the FF reset is input.

The response to a "FFh" Reset command input during the various device operations is as follows:

When a Reset (FFh) command is input during programming
When a Reset (FFh) command is input during erasing

When a Reset (FFh) command is input during Read operation
When a Reset (FFh) command is input during Ready
When a Status Read command (70h) is input after a Reset

I/O status: Pass/Fail → Pass
: Ready/Busy → Ready

When two or more Reset commands are input in succession

The second (FF) command is invalid, but the third (FF) command is valid.

APPLICATION NOTES AND COMMENTS

(1) Power-on/off sequence:

The timing sequence shown in the figure below is necessary for the power-on/off sequence.
The device internal initialization starts after the power supply reaches an appropriate level in the power on sequence. During the initialization the device Ready/Busy signal indicates the Busy state as shown in the figure below. In this time period, the acceptable commands are FFh or 70h.
The $\overline{WP}$ signal is useful for protecting against data corruption at power-on/off.
(2) Power-on Reset

The following sequence is necessary because some input signals may not be stable at power-on.

(3) Prohibition of unspecified commands

The operation commands are listed in Table 3. Input of a command other than those specified in Table 3 is prohibited. Stored data may be corrupted if an unknown command is entered during the command cycle.

(4) Restriction of commands while in the Busy state

During the Busy state, do not input any command except 70h(71h) and FFh.

(5)   Acceptable commands after Serial Input command "80h"

Once the Serial Input command "80h" has been input, do not input any command other than the Column Address Change in Serial Data Input command "85h", Auto Program command "10h", Multi Page Program command "11h", Auto Program with Data Cache Command "15h", or the Reset command "FFh".
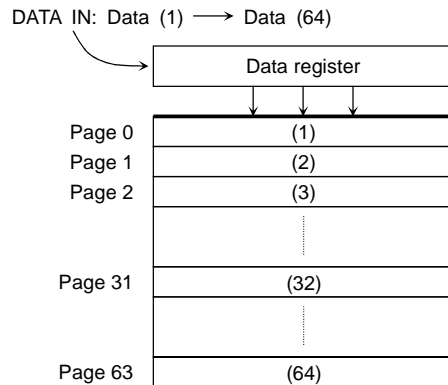

```
   ( 80 )──────────────────────( FF )─────────────────────
                                       ┊
‾WE  ──┐ ┌┐ ┌┐ ┌┐ ┌┐ ┌┐ ┌─────────────────────────────────
       └─┘└─┘└─┘└─┘└─┘└─┘
           └────Address input────┘
                                       ┊
RY/‾BY ─────────────────────────────┐     ┌─────────┐   ┌──
                                    └─────┘         └───┘
```

If a command other than "85h", "10h" , "11h" , "15h" or "FFh" is input, the Program operation is not performed and the device operation is set to the mode which the input command specifies.

```
( 80 )───( XX )                          ( 10 )
              ↑        Mode specified by the command.        Programming cannot be executed.
   Command other than
   "85h", "10h", "11h" , "15h" or "FFh"
```
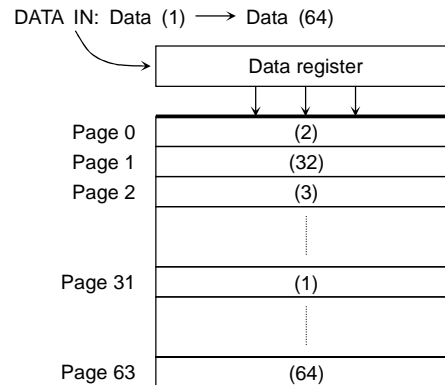

(6)   Addressing for program operation

Within a block, the pages must be programmed consecutively from the LSB (least significant bit) page of the block to MSB (most significant bit) page of the block. Random page address programming is prohibited.
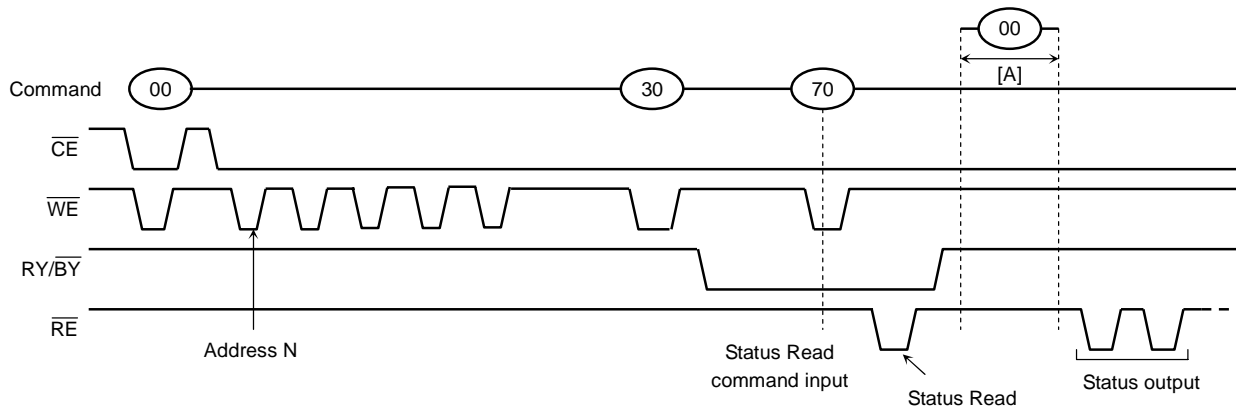

From_the_LSB_page_to_MSB_page   Ex.)_Random_page_program_(Prohibition)

DATA IN: Data (1) ⟶ Data (64)   DATA IN: Data (1) ⟶ Data (64)

Page 63	(64)

|	Data register
Page 0	(2)
Page 1	(32)
Page 2	(3)
	⋮
Page 31	(1)
	⋮
Page 63	(64)

(7) Status Read during a Read operation

The device status can be read out by inputting the Status Read command "70h" in Read mode. Once the device has been set to Status Read mode by a "70h" command, the device will not return to Read mode unless the Read command "00h" is input during [A]. If the Read command "00h" is input during [A], Status Read mode is reset, and the device returns to Read mode. In this case, data output starts automatically from address N and address input is unnecessary.

(8) Auto programming failure

If the programming result for page address M is Fail, do not try to program the page to address N in another block without the data input sequence.

Because the previous input data has been lost, the same input sequence of 80h command, address and data is necessary.

(9) RY / $\overline{BY}$: termination for the Ready/Busy pin (RY / $\overline{BY}$)

A pull-up resistor needs to be used for termination because the RY / $\overline{BY}$ buffer consists of an open drain circuit.

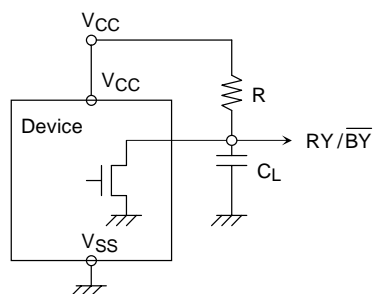

This data may vary from device to device. We recommend that you use this data as a reference when selecting a resistor value.
(10)   Note regarding the $\overline{\text{WP}}$ signal

The Erase and Program operations are automatically reset when $\overline{\text{WP}}$ goes Low. The operations are enabled and disabled as follows:
Enable Programming

t_{WW} (100 ns MIN)

Disable Programming

t_{WW} (100 ns MIN)

Enable Erasing

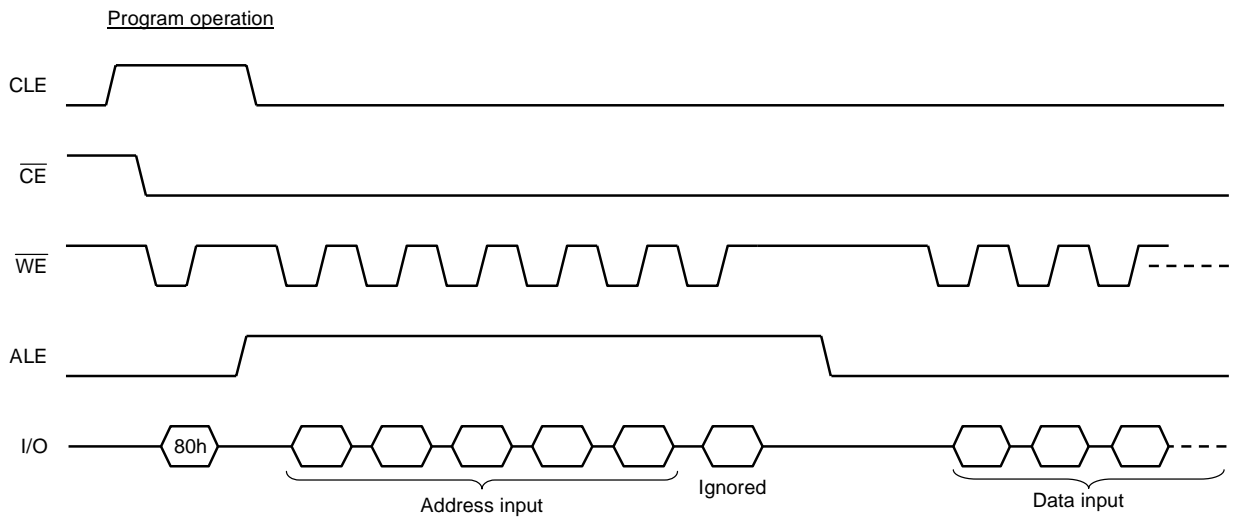

t_{WW} (100 ns MIN)

Disable Erasing

t_{WW} (100 ns MIN)
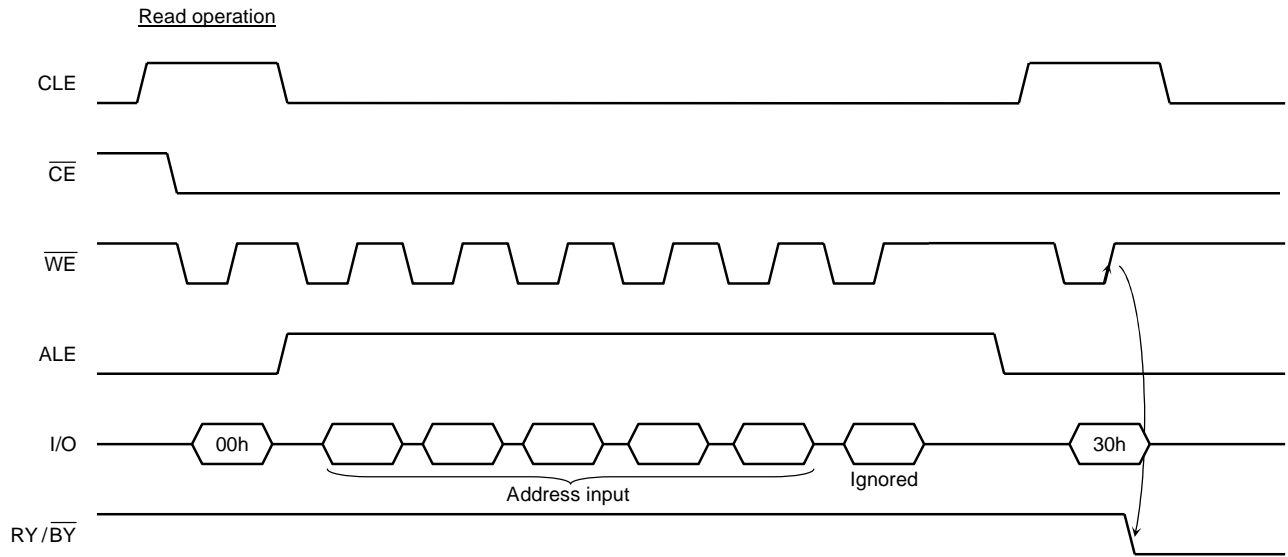

(11)   When six address cycles are input

Although the device may read in a sixth address, it is ignored inside the chip.

Read operation

CLE

$\overline{CE}$

$\overline{WE}$

ALE

I/O   00h   Ignored   30h

                        Address input

RY/$\overline{BY}$

Program operation

CLE

$\overline{CE}$

$\overline{WE}$

ALE

I/O   80h   Ignored   Data input

                        Address input

(12)   Several programming cycles on the same page (Partial Page Program)

Each segment can be programmed individually as follows:

1st programming	Data Pattern 1	All 1 s

2nd programming	All 1 s	Data Pattern 2	All 1 s

4th programming	All 1 s	Data Pattern 4

Result	Data Pattern 1	Data Pattern 2	----------------------------	Data Pattern 4
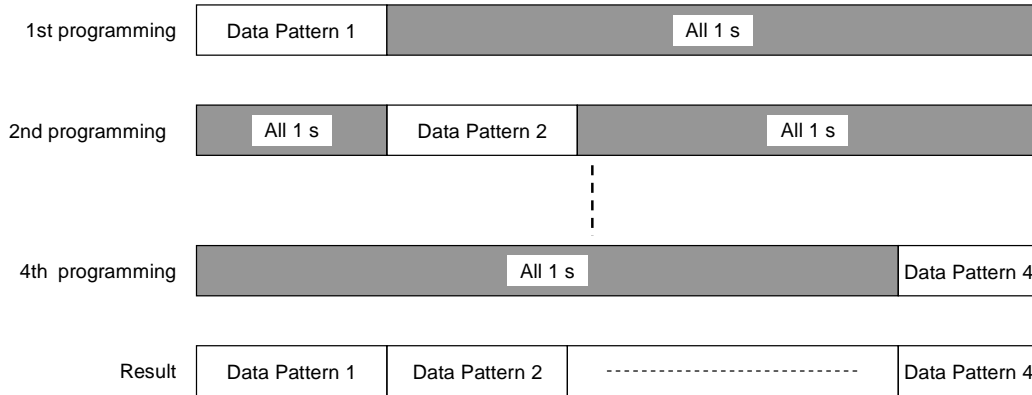

(13)   Invalid blocks (bad blocks)

The device occasionally contains unusable blocks. Therefore, the following issues must be recognized:
Please do not perform an erase operation to bad blocks. It may be impossible to recover the bad block information if the information is erased.
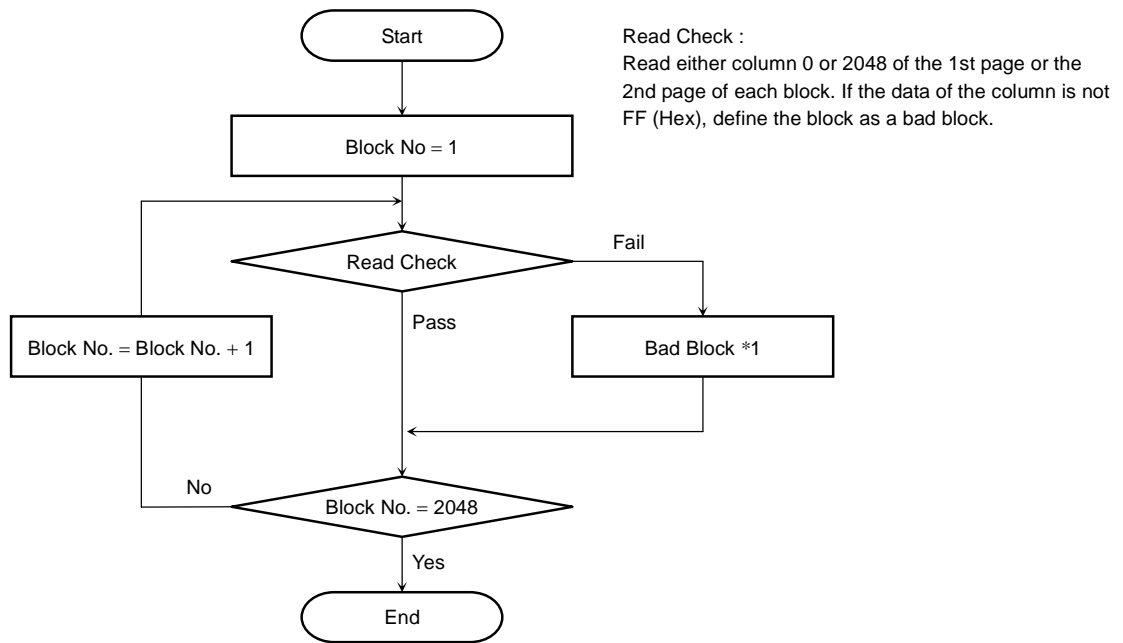

Check if the device has any bad blocks after installation into the system. Refer to the test flow for bad block detection. Bad blocks which are detected by the test flow must be managed as unusable blocks by the system.

A bad block does not affect the performance of good blocks because it is isolated from the bit lines by select gates.

→ Bad Block

→ Bad Block

The number of valid blocks over the device lifetime is as follows:

	MIN	TYP.	MAX	UNIT
Valid (Good) Block Number	2008	—	2048	Block

Bad Block Test Flow

Read Check :
Read either column 0 or 2048 of the 1st page or the 2nd page of each block. If the data of the column is not FF (Hex), define the block as a bad block.

*1:   No erase operation is allowed to detected bad blocks

(14)   Failure phenomena for Program and Erase operations

The device may fail during a Program or Erase operation.
The following possible failure modes should be considered when implementing a highly reliable system.

FAILURE MODE		DETECTION AND COUNTERMEASURE SEQUENCE
Block	Erase Failure	Status Read after Erase → Block Replacement
Page	Programming Failure	Status Read after Program → Block Replacement
Single Bit	Programming Failure "1 to 0"	ECC

- ECC: Error Correction Code.
    1 bit correction per 528 bytess is necessary.
- Block Replacement

Program
When an error happens in Block A, try to reprogram the data into another Block (Block B) by loading from an external buffer. Then, prevent further system accesses to Block A (by creating a bad block table or by using another appropriate scheme).

Erase

When an error occurs during an Erase operation, prevent future accesses to this bad block (again by creating a table within the system or by using another appropriate scheme).

(15)   Do not turn off the power before write/erase operation is complete. Avoid using the device when the battery is low. Power shortage and/or power failure before write/erase operation is completed will cause loss of data and/or damage to data.

Package Dimensions

TSOP I 48-P-1220-0.50   Unit : mm
Weight: 0.53g (typ.)

Revision History

Date	Rev.	Description
2008-08-08	1.00	Original version
2008-09-29	1.10	Deleted EDO Mode
2008-10-10	1.20	Changed the description of I_{CCS}

RESTRICTIONS ON PRODUCT USE

- The information contained herein is subject to change without notice.

- TOSHIBA is continually working to improve the quality and reliability of its products. Nevertheless, semiconductor devices in general can malfunction or fail due to their inherent electrical sensitivity and vulnerability to physical stress. It is the responsibility of the buyer, when utilizing TOSHIBA products, to comply with the standards of safety in making a safe design for the entire system, and to avoid situations in which a malfunction or failure of such TOSHIBA products could cause loss of human life, bodily injury or damage to property.
  In developing your designs, please ensure that TOSHIBA products are used within specified operating ranges as set forth in the most recent TOSHIBA products specifications. Also, please keep in mind the precautions and conditions set forth in the "Handling Guide for Semiconductor Devices," or "TOSHIBA Semiconductor Reliability Handbook" etc.

- The TOSHIBA products listed in this document are intended for usage in general electronics applications (computer, personal equipment, office equipment, measuring equipment, industrial robotics, domestic appliances, etc.). These TOSHIBA products are neither intended nor warranted for usage in equipment that requires extraordinarily high quality and/or reliability or a malfunction or failure of which may cause loss of human life or bodily injury ("Unintended Usage"). Unintended Usage include atomic energy control instruments, airplane or spaceship instruments, transportation instruments, traffic signal instruments, combustion control instruments, medical instruments, all types of safety devices, etc. Unintended Usage of TOSHIBA products listed in this document shall be made at the customer's own risk.

- The products described in this document shall not be used or embedded to any downstream products of which manufacture, use and/or sale are prohibited under any applicable laws and regulations.

- The information contained herein is presented only as a guide for the applications of our products. No responsibility is assumed by TOSHIBA for any infringements of patents or other rights of the third parties which may result from its use. No license is granted by implication or otherwise under any patents or other rights of TOSHIBA or the third parties.

- Please use this product in compliance with all applicable laws and regulations that regulate the inclusion or use of controlled substances.
  Toshiba assumes no liability for damage or losses occurring as a result of noncompliance with applicable laws and regulations.

- The products described in this document are subject to foreign exchange and foreign trade control laws.
