MEMORY

16M(1M x 16bit) Normal mode & Page mode Static Random Access Memory

DESCRIPTION

The A64S06161A is a 16Mb high speed, low power Static Random Access Memory(SRAM) organized as 1,048,576 words by 16 bits and supports Page Mode.
The A64S06161A is a Pseudo SRAM based on successfully proven DRAM CELL *SRAM* which was specifically developed for cost sensitive, low power computing and communication applications such as mobile cellular phone handsets, personal digital assistants and other battery-operated consumer products.

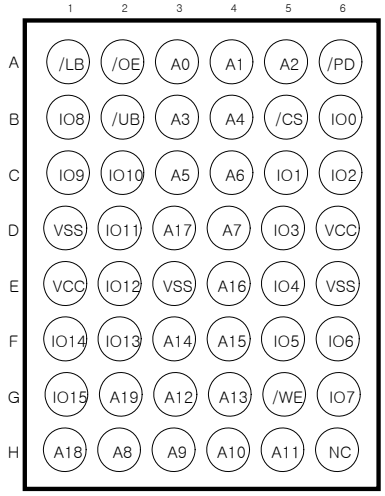
FEATURES

- Standard Asynchronous SRAM Interface and Page Mode
- Organization : 1M x 16Bit
- Power Supply Voltage : 2.7 ~ 3.3 V
- Page Size : 4 words
- Page Mode Access (tPAA) : 35ns
- Data Retention Voltage : 2.4V
- Tri-state Output and TTL Compatible

PRODUCT FAMILY

Product Family	Operating Temperature	Voltage	Speed	ISB1 (Max)	IccDR (Max)	ICC1 (Max)	Mode
A64S06161A	-40 ~ 85 ℃	2.7 ~ 3.3 V	70	100uA	100uA	2.0mA	Page

PIN DESCRIPTION



Note : E3 pin (VSS) can be remain as a NC

FUNCTIONAL BLOCK DIAGRAM

IO0～IO15	Data Input / Output		

PRODUCT LIST

Part Name	Function
A64S06161A-70U	16M, 48-FBGA , 70 ns, 3.0V, -40℃ ~ 85℃

ABSOLUTE MAXIMUM RATING

Item	Symbol	Ratings	Unit
Voltage on any pin relative to Vss	V_{IN}, V_{OUT}	−0.2 to VCC+0.3 V	V
Voltage on Vcc supply relative to Vss	V_{CC}	−0.2 to 3.6	V
Power Dissipation	P_D	1.0	W
Storage temperature	T_{STG}	−55 to 150	℃
Operating Temperature (Extended)	T_A	−40 ~ 85	℃

Note :
Stresses greater than those listed under “ABSOLUTE MAXIMUM RATINGS” may cause permanent damage to the device. This is stress rating only and the functional operation of the device under these or any other conditions above those indicated in the operation of this specification is not implied. Exposure to the absolute maximum rating conditions for extended period may affect reliability.

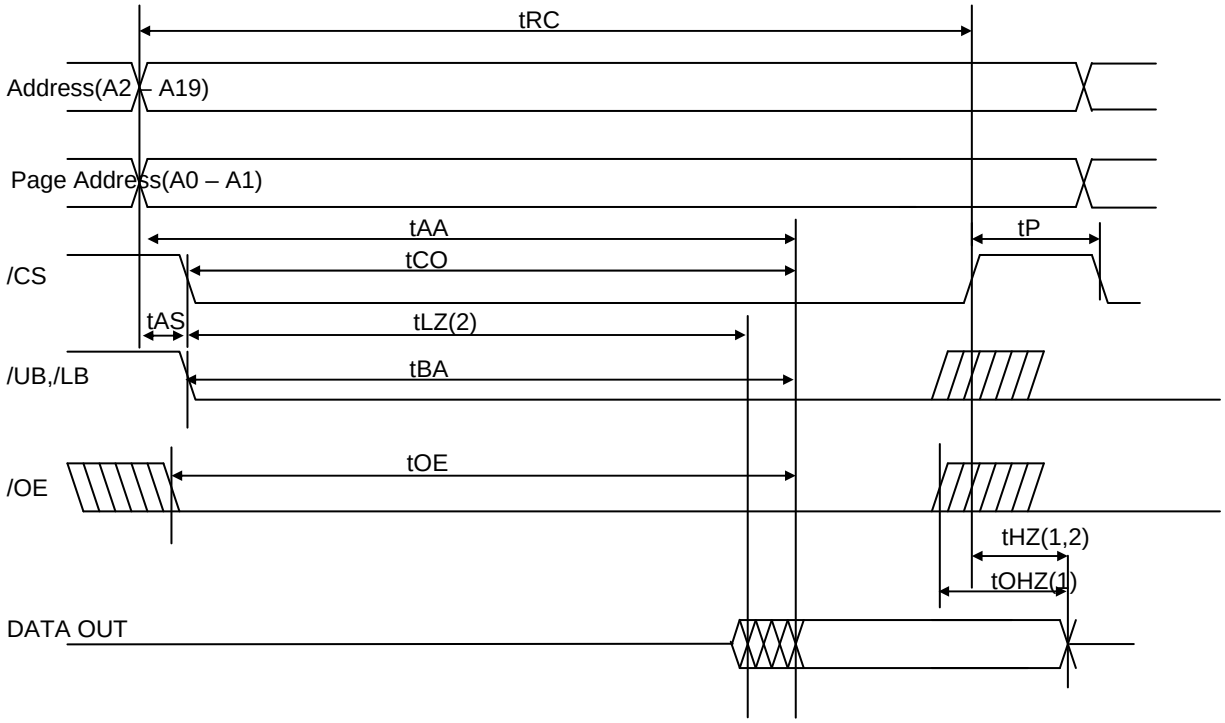
TIMING DIAGRAMS

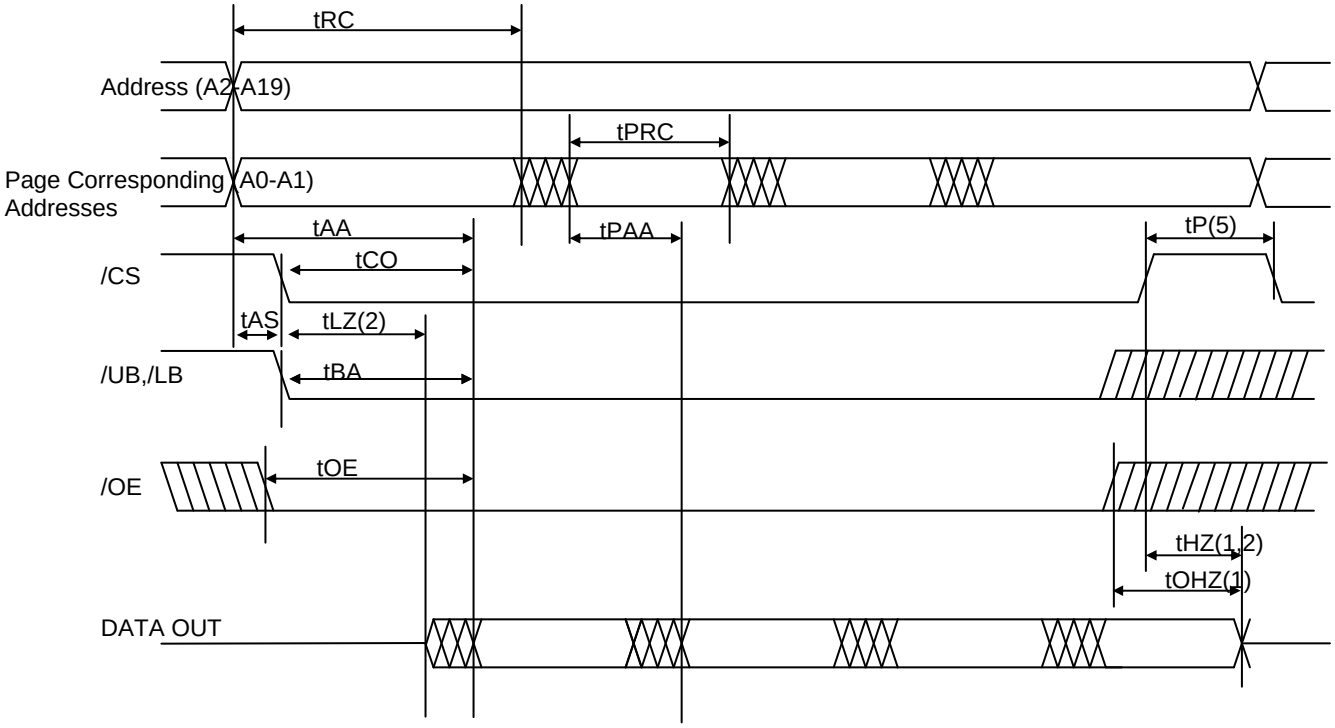
READ CYCLE (/PD = /WE = V_{IH})



Note (READ CYCLE) :

1. tHZ and tOHZ are defined as the time at which the outputs achieve the open circuit conditions and are not referenced to output voltage levels
2. At any given temperature and voltage condition, tHZ(max.) is less than tLZ(min.) both for a given device and from device to device.
3. /WE is high for the read cycle.
4. Do not access device with cycle timing shorter than tRC for continuous periods > 16us.

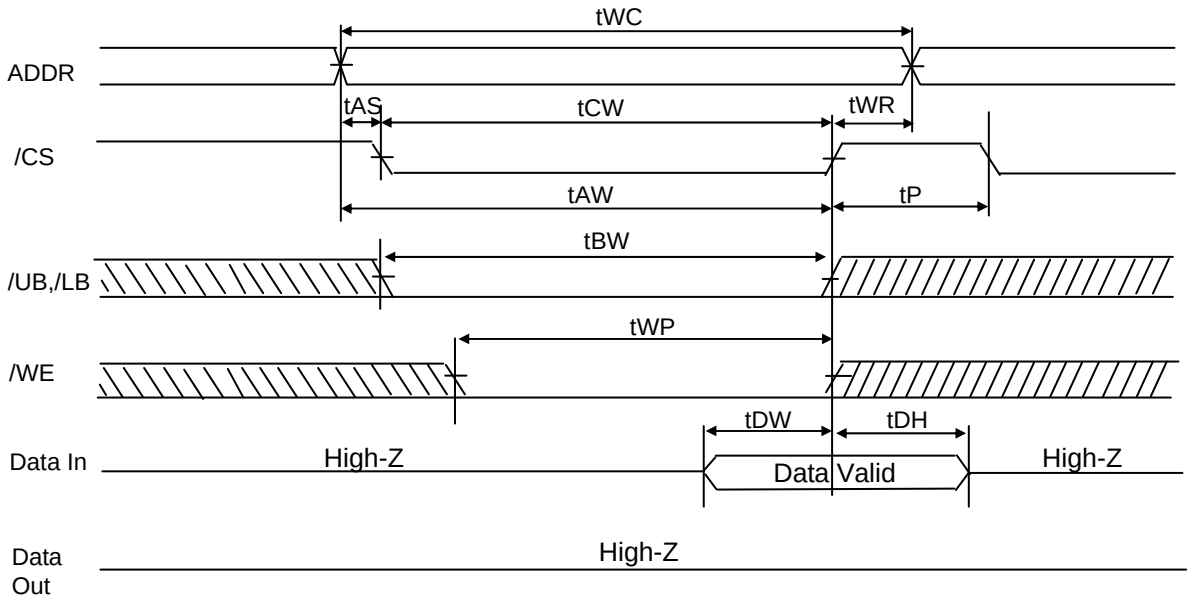
PAGE READ CYCLE (/PD = /WE = V_{IH})



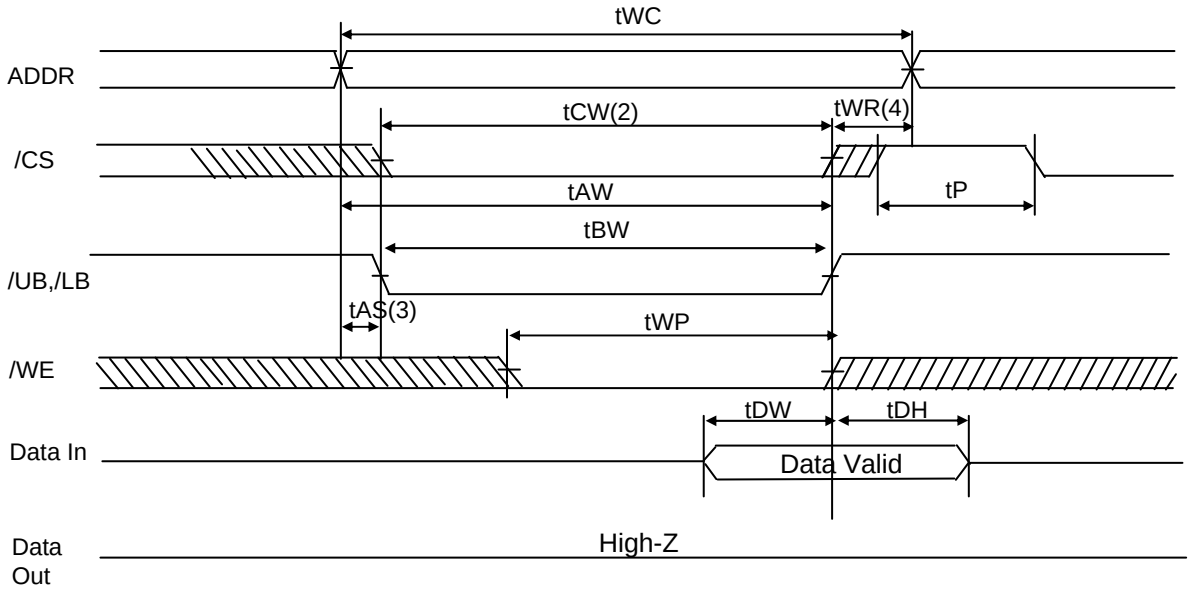
Note (PAGE MODE READ CYCLE) :

1. tHZ and tOHZ are defined as the time at which the outputs achieve the open circuit conditions and are not referenced to output voltage levels
2. At any given temperature and voltage condition, tHZ(max.) is less than tLZ(min.) both for a given device and from device to device.
3. /WE is high for the read cycle.
4. Do not access device with cycle timing shorter than tRC for continuous periods > 16us.
5. tP (precharge time) should be guaranteed for **new Address**.
6. After initial page access is accomplished, the page mode operation provides fast read access speed of random locations within that page

WRITE CYCLE 1 (/CS Controlled, /PD = V_{IH})



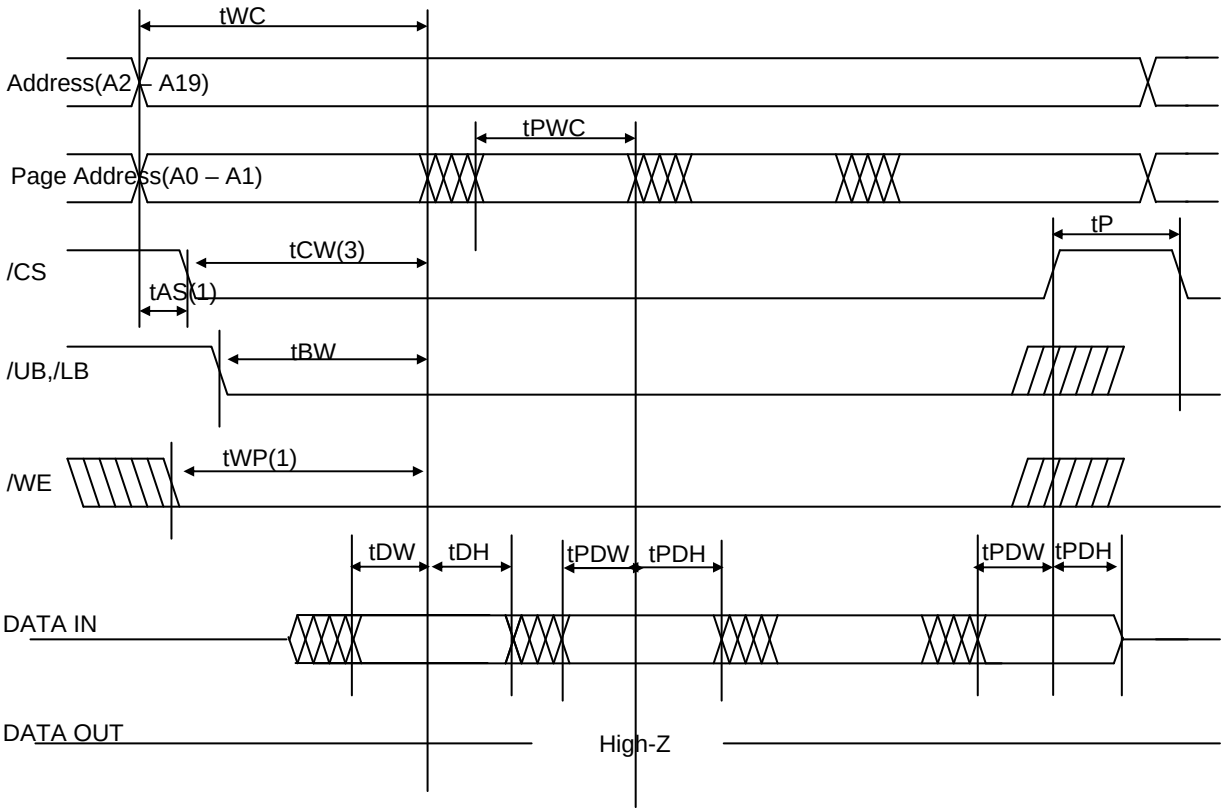
WRITE CYCLE 2 (/UB /LB Controlled, /PD = V_{IH})



Notes (WRITE CYCLE) :

1. A write occurs during the overlap of a low /CS and low /WE. A write begins at the latest transition among /CS going low and /WE going low: A write end at the earliest transition among /CS going high and /WE going high. tWP is measured from the beginning of write to the end of write.
2. tCW is measured from the later of /CS going low to the end of write.
3. tAS is measured from the address valid to the beginning of write.
4. tWR is measured from the end of write to the address change. tWR is applied in case a write ends as /CS.
5. Do not access device with cycle timing shorter than tRC for continuous periods > 16us.

PAGE MODE WRITE CYCLE (/PD = V_{IH})



Notes (PAGE MODE WRITE CYCLE) :

1. A write occurs during the overlap of a low /CS and low /WE.
   A write begins at the latest transition among /CS going low in initial page mode .
   A write end at the earliest transition among /CS going high and **Page Address transition.**
   tWP is measured from the beginning of write to the end of write in initial page access.
2. tPWC is measured from Page Address trasition (After initial page access)
   to Page Address transition or /CS going high.
2. tCW is measured from the later of /CS going low to the end of write in initial page access.
3. tAS is measured from the address valid to the beginning of write.
4. Do not access device with cycle timing shorter than tRC for continuous periods > 16us.
5. tP (precharge time) should be guaranteed for new Page Address.
6. After initial page access is accomplished, the page mode operation provides fast read access speed of random locations within that page
