### **<sup>1</sup>FEATURES DESCRIPTION**

 **Speed and Resolution Grades:** The ADS5287 is <sup>a</sup> high-performance, low-power, octal channel analog-to-digital converter (ADC). Available in a 9mm  $\times$  9mm QFN package, with serialized low-voltage differential signaling (LVDS) outputs and <sup>a</sup> wide variety of programmable features, **53mW/Channel at 40MSPS** the ADS5287 is highly customizable for <sup>a</sup> wide range of applications and offers an unprecedented level of system integration. An application note, XAPP774 (available at [www.xilinx.com](http:// www.xilinx.com)), describes how to **61.7dBFS SNR at 10MHz IF** interface the serial LVDS outputs of TI's ADCs to • Analog Input Full-Scale Range: 2V<sub>PP</sub> Xilinx<sup>®</sup> field-programmable gate arrays (FPGAs). The ADS5287 is specified over the industrial temperature range of  $-40^{\circ}$ C to  $+85^{\circ}$ C.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of ÆÑ Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

#### SBAS428C–JANUARY 2008–REVISED MARCH 2008

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

#### **RELATED PRODUCTS**

#### **ORDERING INFORMATION(1)(2)**

(1) For the most current package and ordering information see the Package Option Addendum at the end of this document, or see the TI web site at [www.ti.com](http://www-s.ti.com/sc/techlit/http://www.ti.com).

(2) These devices meet the following planned eco-friendly classification: **Green (RoHS and No Sb/Br):** Texas Instruments defines *Green* to mean Pb-free (RoHS compatible) and free of bromine (Br)- and antimony (Sb)-based flame retardants. Refer to the Quality and Lead-Free [\(Pb-Free\)](http://focus.ti.com/quality/docs/qualityhome.tsp?DCMP=TIHomeTracking&HQS=Other+OT+home_d_quality) Data web site for more information. These devices have a Cu NiPdAu lead/ball finish.

(3) Refer to the Package Option Addendum at the end of this document for specific transport media and quantity information.

### **ABSOLUTE MAXIMUM RATINGS(1)**

Over operating free-air temperature range, unless otherwise noted.

(1) Stresses above these ratings may cause permanent damage. Exposure to *absolute maximum conditions* for extended periods may degrade device reliability. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those specified is not supported.

<span id="page-2-0"></span>

### **RECOMMENDED OPERATING CONDITIONS**

### **INITIALIZATION REGISTERS**

If the analog input is ac-coupled, the following registers must be be written to in the order listed below.

### **DIGITAL CHARACTERISTICS**

DC specifications refer to the condition where the digital outputs are not switching, but are permanently at <sup>a</sup> valid logic level '0' or '1'. At C<sub>LOAD</sub> = 5pF<sup>(1)</sup>,  $I_{\text{OUT}}$  = 3.5mA<sup>(2)</sup>, R<sub>LOAD</sub> = 100Ω<sup>(2)</sup>, and no internal termination, unless otherwise noted.

(1)  $C_{\text{LOAD}}$  is the effective external single-ended load capacitance between each output pin and ground.

(2)  $\,$  I<sub>OUT</sub> refers to the LVDS buffer current setting; R<sub>LOAD</sub> is the differential load resistance between the LVDS output pair.

### <span id="page-4-0"></span>**ELECTRICAL CHARACTERISTICS**

Typical values at +25°C. Minimum and maximum values are measured across the specified temperature range of  $T_{MIN}$  =  $-40^{\circ}$ C to T<sub>MAX</sub> =  $+85^{\circ}$ C, AVDD = 3.3V, LVDD = 1.8V, clock frequency = 10MSPS to 65MSPS, 50% clock duty cycle, -1dBFS differential analog input, internal reference mode,  $I_{SET}$  resistor = 56.2kΩ, and LVDS buffer current setting = 3.5mA, unless otherwise noted.Typical values at +25°C.

(1) The offset temperature coefficient in ppm/°C is defined as  $(O_1 - O_2) \times 10^6 / (T_1 - T_2) / 1024$ , where  $O_1$  and  $O_2$  are the offset codes in LSB

at the two extreme temperatures, T<sub>1</sub> and T<sub>2</sub>.<br>(2) The internal reference temperature coefficient is defined as (REF<sub>1</sub> – REF<sub>2</sub>) × 10<sup>6</sup>/(T<sub>1</sub> – T<sub>2</sub>)/2, where REF<sub>1</sub> and REF<sub>2</sub> are the internal reference voltages ( $V_{REFT} - V_{REFB}$ ) at the two extreme temperatures,  $T_1$  and  $T_2$ .

(3) DC PSRR is defined as the ratio of the change in the ADC output (expressed in mV) to the change in supply voltage (in volts).

### **ELECTRICAL CHARACTERISTICS (continued)**

Typical values at +25°C. Minimum and maximum values are measured across the specified temperature range of T<sub>MIN</sub> = –40°C to T<sub>MAX</sub> = +85°C, AVDD = 3.3V, LVDD = 1.8V, clock frequency = 10MSPS to 65MSPS, 50% clock duty cycle, –1dBFS differential analog input, internal reference mode, I<sub>SET</sub> resistor = 56.2kΩ, and LVDS buffer current setting = 3.5mA, unless otherwise noted.Typical values at +25°C.

#### **PIN CONFIGURATION**

### **FUNCTIONAL BLOCK DIAGRAM**

### **LVDS TIMING DIAGRAM**

#### **DEFINITION OF SETUP AND HOLD TIMES**

 $t_{SU} = min(t_{SU1}, t_{SU2})$ 

# $t_H = min(t_{H1}, t_{H2})$

### **TIMING CHARACTERISTICS(1)**

(1) Timing parameters are ensured by design and characterization; not production tested.

### **LVDS OUTPUT TIMING CHARACTERISTICS(1)**

Typical values are at +25°C, minimum and maximum values are measured across the specified temperature range of  $T_{MIN} = -40^{\circ}C$  to  $T_{MAX}$ +85°C, sampling frequency = as specified, C<sub>LOAD</sub> = 5pF<sup>(2)</sup>,  $I_{\text{OUT}}$  = 3.5mA, R<sub>LOAD</sub> = 100 $\Omega^{(3)}$ , and no internal termination, unless otherwise noted.

(1) Timing parameters are ensured by design and characterization; not production tested.

 $(2)$  C<sub>LOAD</sub> is the effective external single-ended load capacitance between each output pin and ground.

(3)  $I_{\text{OUT}}$  refers to the LVDS buffer current setting;  $R_{\text{LOAD}}$  is the differential load resistance between the LVDS output pair.<br>(4) Measurements are done with a transmission line of 100 $\Omega$  characteristic impedance

(4) Measurements are done with <sup>a</sup> transmission line of 100Ω characteristic impedance between the device and the load.

(5) Setup and hold time specifications take into account the effect of jitter on the output data and clock. These specifications also assume that data and clock paths are perfectly matched within the receiver. Any mismatch in these paths within the receiver would appear as reduced timing margin.

(6) Data valid refers to <sup>a</sup> logic high of +100mV and <sup>a</sup> logic low of –100mV.

### **LVDS OUTPUT TIMING CHARACTERISTICS(1)**

Typical values are at +25°C, minimum and maximum values are measured across the specified temperature range of  $T_{MIN} = -40^{\circ}C$  to  $T_{MAX}$ +85°C, sampling frequency = as specified, C<sub>LOAD</sub> = 5pF<sup>(2)</sup>,  $I_{\text{OUT}}$  = 3.5mA, R<sub>LOAD</sub> = 100 $\Omega^{(3)}$ , and no internal termination, unless otherwise noted.

(1) Timing parameters are ensured by design and characterization; not production tested.

 $(2)$   $C<sub>LOAD</sub>$  is the effective external single-ended load capacitance between each output pin and ground.

(3)  $I<sub>OUT</sub> refers to the LVDS buffer current setting;  $R<sub>LOAD</sub>$  is the differential load resistance between the LVDS output pair.$ 

(4) Measurements are done with <sup>a</sup> transmission line of 100Ω characteristic impedance between the device and the load.

(5) Setup and hold time specifications take into account the effect of jitter on the output data and clock. These specifications also assume that data and clock paths are perfectly matched within the receiver. Any mismatch in these paths within the receiver would appear as reduced timing margin.

(6) Data valid refers to <sup>a</sup> logic high of +100mV and <sup>a</sup> logic low of –100mV.

#### **RECOMMENDED POWER-UP SEQUENCING AND RESET TIMING(1)**

 $10\mu$ s <  $t_1$  < 50ms,  $10\mu$ s <  $t_2$  < 50ms,  $-10$ ms <  $t_3$  < 10ms,  $t_4$  > 10ms,  $t_5$  > 100ns,  $t_6$  > 100ns,  $t_7$  > 10ms, and  $t_8$  > 100 $\mu$ s.

(1) The AVDD and LVDD power-on sequence does not matter as long as  $-10\text{ms} < t_3 < 10\text{ms}$ . Similar considerations apply while shutting down the device.

(2) Write initialization registers listed in the Initialization [Registers](#page-2-0) table.

#### **POWER-DOWN TIMING**

Power-up time shown is based on 1µF bypass capacitors on the reference pins.  $t_{WAKE}$  is the time it takes for the device to wake up completely from power-down mode. The ADS5287 has two power-down modes: complete power-down mode and partial power-down mode. The device can be configured in partial power-down mode through <sup>a</sup> register setting.

 $t_{\text{WAKE}}$  < 50 $\mu$ s for complete power-down mode.

t<sub>WAKE</sub> < 2µs for partial power-down mode (provided the clock is not shut off during power-down).

### **SERIAL INTERFACE**

The ADS5287 has a set of internal registers that can be accessed through the serial interface formed by pins  $\overline{CS}$ (chip select, active low), SCLK (serial interface clock), and SDATA (serial interface data). When CS is low, the following actions occur:

- •Serial shift of bits into the device is enabled
- SDATA (serial data) is latched at every rising edge of SCLK
- SDATA is loaded into the register at every 24th SCLK rising edge

If the word length exceeds <sup>a</sup> multiple of 24 bits, the excess bits are ignored. Data can be loaded in multiples of 24-bit words within a single active  $\overline{\text{CS}}$  pulse. The first eight bits form the register address and the remaining 16 bits form the register data. The interface can work with SCLK frequencies from 20MHz down to very low speeds (a few hertz) and also with <sup>a</sup> non-50% SCLK duty cycle.

#### **Register Initialization**

After power-up, the internal registers *must* be initialized to the respective default values. Initialization can be done in one of two ways:

- 1. Through a hardware reset, by applying a low-going pulse on the RESET pin; or
- 2. Through <sup>a</sup> software reset; using the serial interface, set the RST bit high. Setting this bit initializes the internal registers to the respective default values and then self-resets the RST bit low. In this case, the RESET pin stays high (inactive).

#### **SERIAL INTERFACE TIMING**

### **SERIAL REGISTER MAP**

# **Table 2. SUMMARY OF FUNCTIONS SUPPORTED BY SERIAL INTERFACE(1)(2)(3)(4)**

(1) The unused bits in each register (identified as blank table cells) must be programmed as '0'.

(2) X <sup>=</sup> Register bit referenced by the corresponding name and description (default is 0).

(3) Bits marked as '0' should be forced to 0, and bits marked as '1' should be forced to 1 when the particular register is programmed.<br>(4) Multiple functions in a register should be programmed in a single write operation.

Multiple functions in a register should be programmed in a single write operation.

J ja **W** TEXAS<br>INSTRUMENTS **www.ti.com**

#### **Table 2. SUMMARY OF FUNCTIONS SUPPORTED BY SERIAL INTERFACE (continued)**

### **SUMMARY OF FEATURES**

### **DESCRIPTION OF SERIAL REGISTERS**

#### **SOFTWARE RESET**

Software reset is applied when the RST bit is set to '1'; setting this bit resets all internal registers and self-clears to '0'.

#### **POWER-DOWN MODES**

Each of the eight channels can be individually powered down. PDN\_CH<N> controls the power-down mode for the ADC channel <N>.

In addition to channel-specific power-down, the ADS5287 also has two global power-down modes—partial power-down mode and complete power-down mode. Partial power-down mode partially powers down the chip; recovery from this mode is much quicker, provided that the clock has been running for at least 50µ<sup>s</sup> before exiting this mode. Complete power-down mode, on the other hand, completely powers down the chip, and involves <sup>a</sup> much longer recovery time.

In addition to programming the device for either of these two power-down modes (through either the PDN\_PARTIAL or PDN\_COMPLETE bits, respectively), the PD pin itself can be configured as either a partial power-down pin or a complete power-down pin control. For example, if PDN\_PIN\_CFG = 0 (default), when the PD pin is high, the device enters complete power-down mode. However, if PDN\_PIN\_CFG = 1, when the PD pin is high, the device enters partial power-down mode.

#### **LVDS DRIVE PROGRAMMABILITY**

The LVDS drive strength of the bit clock (LCLK<sub>P</sub> or LCLK<sub>N</sub>) and the frame clock (ADCLK<sub>P</sub> or ADCLK<sub>N</sub>) can be individually programmed. The LVDS drive strengths of all the data outputs  $OUT<sub>P</sub>$  and  $OUT<sub>N</sub>$  can also be programmed to the same value.

All three drive strengths (bit clock, frame clock, and data) are programmed using sets of three bits. Table 3 shows an example of how the drive strength of the bit clock is programmed (the method is similar for the frame clock and data drive strengths).

#### **Table 3. Bit Clock Drive Strength(1)**

(1) Current settings lower than 1.5mA are not recommended.

#### **LVDS INTERNAL TERMINATION PROGRAMMABILITY**

The LVDS buffers have high-impedance current sources driving the outputs. When driving traces whose characteristic impedance is not perfectly matched with the termination impedance on the receiver side, there may be reflections back to the LVDS output pins of the ADS5287 that cause degraded signal integrity. By enabling an internal termination (between the positive and negative outputs) for the LVDS buffers, the signal integrity can be significantly improved in such scenarios. To set the internal termination mode, the EN\_LVDS\_TERM bit should be set to '1'. Once this bit is set, the internal termination values for the bit clock, frame clock, and data buffers can be independently programmed using sets of three bits. Table 4 shows an example of how the internal termination of the LVDS buffer driving the bit clock is programmed (the method is similar for the frame clock and data buffers). These termination values are only typical values and can vary by up to ±20% across temperature and from device to device.

#### **Table 4. Bit Clock Drive Strengths**

#### **LOW-FREQUENCY NOISE SUPPRESSION MODE**

The low-frequency noise suppression mode is specifically useful in applications where good noise performance is desired in the frequency band of 0MHz to 1MHz (around dc). Setting this mode shifts the low-frequency noise of the ADS5287 to approximately  $f_5/2$ , thereby moving the noise floor around dc to a much lower value. LFNS CH<8:1> enables this mode individually for each channel.

#### **ANALOG INPUT INVERT**

Normally, the  $IN<sub>P</sub>$  pin represents the positive analog input pin, and  $IN<sub>N</sub>$  represents the complementary negative input. Setting the bits marked INVERT\_CH<8:1> (individual control for each channel) causes the inputs to be swapped.  $IN_{N}$  now represents the positive input, and  $IN_{P}$  the negative input.

#### **LVDS TEST PATTERNS**

The ADS5287 can output <sup>a</sup> variety of test patterns on the LVDS outputs. These test patterns replace the normal ADC data output. Setting EN\_RAMP to '1' causes all the channels to output <sup>a</sup> repeating full-scale ramp pattern. The ramp increments from zero code to full-scale code in steps of 1LSB every clock cycle. After hitting the full-scale code, it returns back to zero code and ramps again.

The device can also be programmed to output <sup>a</sup> constant code by setting SINGLE\_CUSTOM\_PAT to '1', and programming the desired code in BITS\_CUSTOM1<9:0>. In this mode, BITS\_CUSTOM1<9:0> take the place of the 10-bit ADC data at the output, and are controlled by LSB-first and MSB-first modes in the same way as normal ADC data are.

The device may also be made to toggle between two consecutive codes by programming DUAL\_CUSTOM\_PAT to '1'. The two codes are represented by the contents of BITS\_CUSTOM1<9:0> and BITS\_CUSTOM2<9:0>.

In addition to custom patterns, the device may also be made to output two preset patterns:

- 1. **Deskew patten:** Set using PAT\_DESKEW, this mode causes the 12 serial bits to come out as 010101010101 (the rightmost bit representing the first bit in the LSB-first mode)
- 2. **Sync pattern:** Set using PAT\_SYNC, this mode causes the 12 serial bits to come out as 111111000000 (the rightmost bit representing the first bit in the LSB-first mode)

Note that only one of the above patterns should be active at any given instant.

#### **PROGRAMMABLE GAIN**

In applications where the full-scale swing of the analog input signal is much less than the  $2V_{\text{PP}}$  range supported by the ADS5287, <sup>a</sup> programmable gain can be set to achieve the full-scale output code even with <sup>a</sup> lower analog input swing. The programmable gain not only fills the output code range of the ADC, but also enhances the SNR of the device by utilizing quantization information from some extra internal bits. The programmable gain for each channel can be individually set using <sup>a</sup> set of four bits, indicated as GAIN\_CHN<3:0> for Channel N. The gain setting is coded in binary from 0dB to 12dB, as shown in Table 5.

GAIN_CH1<3>	GAIN_CH1<2>	GAIN_CH1<1>	GAIN_CH1<0>	<b>CHANNEL 1 GAIN SETTING</b>		
0	0	0	0	0dB		
$\mathbf 0$	$\mathbf 0$	$\Omega$		1dB		
$\mathbf 0$	0		0	2dB		
0	0			3dB		
$\mathbf 0$		0	0	4dB		
$\mathbf 0$		$\Omega$		5dB		
$\mathbf 0$			$\mathbf 0$	6dB		
$\mathbf 0$				7dB		
	0	0	0	8dB		
	$\mathbf 0$	$\Omega$		9dB		
	0		0	10dB		
	$\Omega$			11dB		
		0	0	12dB		
		0		Do not use		
			0	Do not use		
				Do not use		

**Table 5. Gain Setting for Channel 1**

#### **INPUT CLOCK**

The ADS5287 is configured by default to operate with a single-ended input clock—CLK<sub>P</sub> is driven by a CMOS clock and CLK<sub>N</sub> is tied to '0'. However, by programming DIFF\_CLK to '1', the device can be made to work with a differential input clock on CLK<sub>P</sub> and CLK<sub>N</sub>. Operating with a low-jitter differential clock usually gives better SNR performance, especially at input frequencies greater than 30MHz.

In cases where the duty cycle of the input clock falls outside the 45% to 55% range, it is recommended to enable an internal duty cycle correction circuit. This enabling is done by setting the EN\_DCC bit to '1'.

#### **EXTERNAL REFERENCE**

The ADS5287 can be made to operate in external reference mode by pulling the INT/ $\overline{\text{EXT}}$  pin to '0'. In this mode, the REF<sub>T</sub> and REF<sub>B</sub> pins should be driven with voltage levels of 2.5V and 0.5V, respectively, and must have enough drive strength to drive the switched capacitance loading of the reference voltages by each ADC. The advantage of using the external reference mode is that multiple ADS5287 units can be made to operate with the same external reference, thereby improving parameters such as gain matching across devices. However, in applications that do not have an available high drive, differential external reference, the ADS5287 can still be driven with a single external reference voltage on the  $V_{CM}$  pin. When  $EXT\_REF\_VCM$  is set as '1' (and the INT/EXT pin is set to '0'), the V<sub>CM</sub> pin is configured as an input pin, and the voltages on REF<sub>T</sub> and REF<sub>B</sub> are generated as shown in Equation 1 and Equation 2.

VREF<sub>T</sub> = 1.5V + 
$$
\frac{V_{CM}}{1.5V}
$$
 (1)  
VREF<sub>B</sub> = 1.5V -  $\frac{V_{CM}}{1.5V}$  (2)

<span id="page-20-0"></span>

#### **BIT CLOCK PROGRAMMABILITY**

The output interface of the ADS5287 is normally <sup>a</sup> DDR interface, with the LCLK rising edge and falling edge transitions in the middle of alternate data windows. Figure 1 shows this default phase.

The phase of LCLK can be programmed relative to the output frame clock and data using bits PHASE\_DDR<1:0>. The LCLK phase modes are shown in Figure 2.

In addition to programming the phase of LCLK in the DDR mode, the device can also be made to operate in SDR mode by setting the EN\_SDR bit to '1'. In this mode, the bit clock (LCLK) is output at 12x times the input clock, or twice the rate as in DDR mode. Depending on the state of FALL\_SDR, LCLK may be output in either of the two manners shown in Figure 3. As shown in Figure 3, only the LCLK rising (or falling) edge is used to capture the output data in SDR mode.

**EN\_SDR = '1', FALL\_SDR = '1'**

**Figure 3. SDR Interface Modes**

The SDR mode does not work well beyond 40MSPS because the LCLK frequency becomes very high.

#### **DATA OUTPUT FORMAT MODES**

The ADC output, by default, is in straight offset binary mode. Programming the BTC\_MODE bit to '1' inverts the MSB, and the output becomes binary two's complement mode.

Also by default, the first two bits of the frame (following the rising edge of  $ADCLK<sub>P</sub>$ ) are zeroes, followed by the LSB of the ADC output. Programming the MSB FIRST mode inverts the bit order in the word. Thus, in the  $MSB$  FIRST mode, the MSB is output as the first bit following the ADCLK<sub>P</sub> rising edge. The two zeroes come after the LSB at the end of the word.

### **TYPICAL CHARACTERISTICS**

Typical values at +25°C. Minimum and maximum values are measured across the specified temperature range of  $T_{\text{MIN}} =$  $-40^{\circ}$ C to T<sub>MAX</sub> =  $+85^{\circ}$ C, AVDD = 3.3V, LVDD = 1.8V, clock frequency = 10MSPS to 65MSPS, 50% clock duty cycle, -1dBFS differential analog input, internal reference mode,  $I_{SET}$  resistor = 56.2kΩ, and LVDS buffer current setting = 3.5mA, unless otherwise noted.Typical values at +25°C.

This<br>of -1V to correspond to the zero code of the ADC, differential topology results in very good ac of –1V to correspond to the zero code of the ADC, differential topology results in very good ac<br>and a differential input of +1V to correspond to the performance, even for high input frequencies at high full-scale code (1023 LSB). V<sub>CM</sub> (the common-mode sampling rates. The IN<sub>N</sub> and IN<sub>P</sub> pins must be voltage of  $REF_{T}$  and  $REF_{B}$ ) is also made available externally biased around a common-mode voltage of externally through a pin, and is nominally 1.5V.  $\frac{1.5V}{1.5V}$ , available on V<sub>CM</sub>. For a full-scale differential

The ADC employs <sup>a</sup> pipelined converter architecture that consists of a combination of multi-bit and single-bit internal stages. Each stage feeds its data into the digital error correction logic, ensuring excellent differential linearity and no missing codes at the 10-bit level.

The ADC output goes to <sup>a</sup> serializer that operates from <sup>a</sup> 12x clock generated by the PLL. The 12 data

The ADS5287 operates from two sets of supplies and grounds. The analog supply and ground set is identified as AVDD and AVSS, while the digital set is identified by LVDD and LVSS.

#### **ANALOG INPUT**

performance, even for high input frequencies at high input, each input pin  $\left(\mathsf{IN}_N\right)$  and  $\mathsf{IN}_P$ ) must swing symmetrically between  $V_{CM}$  + 0.5V and  $V_{CM}$  – 0.5V, resulting in a  $2V_{PP}$  differential input swing. The maximum input peak-to-peak differential swing is determined to be the difference between the internal reference voltages  $REF_{T}$  (2.5V nominal) and  $REF_{B}$ (0.5V nominal). [Figure](#page-28-0) 31 illustrates the model of the input driving circuit.

<span id="page-28-0"></span>

**Figure 31. Analog Input Circuit Model**

(3)

#### **Input Common-Mode Current**

The input stage of all eight ADCs together sinks a common-mode current on the order of 2mA at 50MSPS. Equation 3 describes the dependency of the common-mode current and the sampling frequency.

 $(2mA) \times f_s$ 

$$
\overline{\text{50MSPS}}
$$

If the driving stage is dc-coupled to the inputs, then Equation 3 can be used to determine its common-mode drive capability and impedance. The inputs can also be ac-coupled to the  $IN<sub>N</sub>$  and  $IN<sub>P</sub>$ pins. In that case, the input common-mode is set by two internal 1.2kΩ resistors connecting the input pins to  $V_{CM}$ . This architecture is shown in Figure 32.

When the inputs are ac-coupled, there is <sup>a</sup> drop in the voltages at  $IN_{\rm P}$  and  $IN_{\rm N}$  relative to  $V_{\rm CM}$ . This can Dashed area denotes one of eight channels. be computed from Equation 3. At 50MSPS, for example, the drop at each of the 16 input pins is 150mV, which is not optimal for ADC operation. *Initialization Registers 1 and 5*, described in the [Initialization](#page-2-0) Register table, can be used to partially reduce the effect of this input common-mode drop

during ac-coupling by increasing  $V_{CM}$  by roughly 75mV. When operating above 50MSPS, it is recommended that additional parallel resistors be added externally to restore the input common-mode to at least 1.4V, if the inputs are to be ac-coupled.

#### **Figure 32. Common-Mode Biasing of Input Pins**

#### **Driving Circuit**

For optimum performance, the analog inputs must be driven differentially. This approach improves the common-mode noise immunity and even-order harmonic rejection. Input configurations using RF transformers suitable for low and high input frequencies are shown in Figure 33 and Figure 34, respectively. The single-ended signal is fed to the primary winding of the RF transformer. The transformer is terminated by 50Ω resistor on the secondary side. Placing the termination on the secondary side helps to shield the kicks caused by the input sampling capacitors from the RF transformer leakage inductances. The termination is accomplished by two 25Ω resistors, connected in series, with the center point connected to the 1.5V common-mode. The 4.7Ω resistor in series with each input pin is required to damp the ringing caused by the device package parasitics.

At high input frequencies, the mismatch in the transformer parasitic capacitance (between the windings) results in degraded even-order harmonic performance. Connecting two identical RF transformers back-to-back helps to minimize this mismatch, and good performance is obtained for<br>high-frequency input signals. An additional high-frequency input signals. termination resistor pair is required between the two transformers, as shown in Figure 34. The center point of this termination is connected to ground to improve the balance between the positive and negative sides. The values of the terminations between the transformers and on the secondary side must be chosen to achieve an overall 50Ω (in the case of 50Ω source impedance).

**Figure 33. Drive Circuit at Low Input Frequencies**

**Figure 34. Drive Circuit at High Input Frequencies**

### **CLOCK INPUT**

The eight channels on the device operate from <sup>a</sup> single ADCLK input. To ensure that the aperture delay and jitter are the same for all channels, <sup>a</sup> clock tree network is used to generate individual sampling clocks to each channel. The clock paths for all the channels are matched from the source point to the sampling circuit. This architecture ensures that the performance and timing for all channels are identical. The use of the clock tree for matching introduces an aperture delay that is defined as the delay between the rising edge of ADCLK and the actual instant of sampling. The aperture delays for all the channels are matched to the best possible extent. A mismatch of  $\pm 20$ ps ( $\pm 3\sigma$ ) could exist between the aperture instants of the eight ADCs within the same chip. **Figure 36. Internal Clock Buffer** However, the aperture delays of ADCs across two different chips can be several hundred picoseconds apart.

The ADS5287 can be made to operate either in CMOS single-ended clock mode (default is  $DIFF_CLK = 0$ ) or differential clock mode (SINE, LVPECL, or LVDS). When operating in the single-ended clock mode,  $CLK<sub>N</sub>$  must be forced to  $0V_{DC}$ , and the single-ended CMOS applied on the  $CLK<sub>P</sub>$  pin. This operation is shown in Figure 35.

#### **Figure 35. Single-Ended Clock Driving Circuit (DIFF\_CLK <sup>=</sup> 0)**

When configured to operate in the differential clock  $\text{mode}$  (register bit  $\text{DIFF\_CLK} = 1$ ) the ADS5287 clock inputs can be driven differentially (SINE, LVPECL, or LVDS) with little or no difference in performance between them, or with <sup>a</sup> single-ended (LVCMOS). The common-mode voltage of the clock inputs is set to V<sub>CM</sub> using internal 5kΩ resistors, as shown in Figure 36. This method allows using transformer-coupled drive circuits for <sup>a</sup> sine wave clock or ac-coupling for LVPECL and LVDS clock sources, as shown in Figure 37. When operating in the differential clock mode, the single-ended CMOS clock can be ac-coupled to the  $CLK<sub>p</sub>$  input, with  $CLK<sub>N</sub>$ (pin 11) connected to ground with <sup>a</sup> 0.1µF capacitor, as shown in Figure 38.

**Figure 37. Differential Clock Driving Circuit (DIFF\_CLK <sup>=</sup> 1)**

**Figure 38. Single-Ended Clock Driving Circuit**

For best performance, the clock inputs must be driven differentially in order to reduce susceptibility to common-mode noise. For high input frequency sampling, it is recommended to use <sup>a</sup> clock source with very low jitter. Bandpass filtering of the clock source can help reduce the effect of jitter. If the duty cycle deviates from 50% by more than 2% or 3%, it is recommended to enable the DCC through register bit EN\_DCC.

### **INPUT OVER-VOLTAGE RECOVERY**

The differential peak-to-peak full-scale range supported by the ADS5287 is nominally 2.0V. The ADS5287 is specially designed to handle an over-voltage condition where the differential peak-to-peak voltage can be up to twice the ADC full-scale range. If the input common-mode is not considerably off from  $V_{CM}$  during overload (less than 300mV around the nominal value of 1.5V), recovery from an over-voltage pulse input of twice the amplitude of <sup>a</sup> full-scale pulse is expected to be within one clock cycle when the input switches from overload to zero signal.

### **REFERENCE CIRCUIT**

The digital beam-forming algorithm in an ultrasound system relies on gain matching across all receiver The device also supports the use of external channels. A typical system would have about 12 octal reference voltages. There are two methods to force ADCs on the board. In such <sup>a</sup> case, it is critical to the references externally. The first method involves ensure that the gain is matched, essentially requiring pulling INT/ $\overline{EXT}$  low and forcing externally REF<sub>T</sub> and the reference voltages seen by all the ADCs to be the REF<sub>B</sub> to 2.5V and 0.5V nominally, respectively. In this same. Matching references within the eight channels mode, the internal reference buffer goes to <sup>a</sup> 3-state of <sup>a</sup> chip is done by using <sup>a</sup> single internal reference output. The external reference driving circuit should voltage buffer. Trimming the reference voltages on be designed to provide the required switching current each chip during production ensures that the for the eight ADCs inside the chip. It should be noted reference voltages are well-matched across different that in this mode,  $V_{CM}$  and  $I_{SFT}$  continue to be chips. generated from the internal bandgap voltage, as in

All bias currents required for the internal operation of the device are set using an external resistor to ground at the  $I_{\text{SET}}$  pin. Using a 56.2k $\Omega$  resistor on  $I_{\text{SET}}$  within 50mV of V<sub>CM</sub>. generates an internal reference current of 20µA. This current is mirrored internally to generate the bias The second method of forcing the reference voltages current for the internal blocks. Using a larger external externally can be accessed by pulling INT/EXT low, resistor at  $I_{\text{SFT}}$  reduces the reference bias current and and programming the serial interface to drive the thereby scales down the device operating power. external reference mode through the  $V_{CM}$  pin (register However, it is recommended that the external resistor bit called  $EXT\_REF\_VCM$ ). In this mode,  $V_{CM}$ be within 10% of the specified value of 56.2kΩ so becomes configured as an input pin that can be that the internal bias margins for the various blocks driven from external circuitry. The internal reference

Buffering the internal bandgap voltage also generates the common-mode voltage  $V_{CM}$ , which is set to the midlevel of  $REF_{T}$  and  $REF_{B}$ , and is accessible on pin 53. It is meant as <sup>a</sup> reference voltage to derive the input common-mode if the input is directly coupled. It can also be used to derive the reference common-mode voltage in the external reference mode. The suggested decoupling for the reference pins is shown in Figure 39.

**TEXAS STRUMENTS** 

#### **Figure 39. Suggested Decoupling on the Reference Pins**

the internal reference mode. It is therefore important to ensure that the common-mode voltage of the externally-forced reference voltages matches to

are proper.  $\blacksquare$  buffers driving  $REF_{T}$  and  $REF_{B}$  are active in this mode. Forcing 1.5V on the  $V_{CM}$  pin in the mode results in  $REF_T$  and  $REF_B$  coming to 2.5V and 0.5V, respectively. In general, the voltages on  $REF_{T}$  and  $REF<sub>B</sub>$  in this mode are given by Equation 4 and Equation 5, respectively:

VREF<sub>T</sub> = 1.5V + 
$$
\frac{V_{CM}}{1.5V}
$$
 (4)  
VREF<sub>B</sub> = 1.5V -  $\frac{V_{CM}}{1.5V}$  (5)

[Table](#page-32-0) 6 describes the state of the reference voltage internal buffers during various combinations of the PD, INT/EXT, and EXT\_REF\_VCM register bits.

<b>REGISTER BIT</b>	<b>INTERNAL BUFFER STATE</b>

#### **NOISE COUPLING ISSUES**

High-speed mixed signals are sensitive to various types of noise coupling. One primary source of noise is the switching noise from the serializer and the output buffers. Maximum care is taken to isolate these noise sources from the sensitive analog blocks. As <sup>a</sup> starting point, the analog and digital domains of the device are clearly demarcated. AVDD and AVSS are used to denote the supplies for the analog sections, while LVDD and LVSS are used to denote It is recommended that the isolation be maintained on the digital supplies. Care is taken to ensure that there the board by using separate supplies to drive AVDD is minimal interaction between the supply sets within and LVDD, as well as separate ground planes for is minimal interaction between the supply sets within and LVDD, as well as separate ground planes for the extent of noise coupled and AVSS and LVSS. The use of LVDS buffers reduces the device. The extent of noise coupled and AVSS and LVSS. The use of LVDS buffers reduces<br>transmitted from the digital to the analog sections the injected noise considerably, compared to CMOS transmitted from the digital to the analog sections depends on:

- 1. The effective inductances of each of the supply and ground sets.
- 2. The isolation between the digital and analog supply and ground sets.

Smaller effective inductance of the supply and ground pins leads to better noise suppression. For this reason, multiple pins are used to drive each supply and ground. It is also critical to ensure that the impedances of the supply and ground lines on the board are kept to the minimum possible values. Use of ground planes in the printed circuit board (PCB) as well as large decoupling capacitors between the supply and ground lines are necessary to obtain the best possible SNR performance from the device.

buffers. The current in the LVDS buffer is independent of the direction of switching. Also, the low output swing as well as the differential nature of the LVDS buffer results in low-noise coupling.

#### **PACKAGING INFORMATION**

**(1)** The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

**(2)** Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

**(3)** MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute <sup>a</sup> license from TI to use such products or services or <sup>a</sup> warranty or endorsement thereof. Use of such information may require <sup>a</sup> license from <sup>a</sup> third party under the patents or other intellectual property of the third party, or <sup>a</sup> license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where <sup>a</sup> failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
