

The PJ79L00 Series negative voltage regulators are inexpensive, easy-to-use devices suitable for a multitude of applications that require up to 100 mA. Like their higher powered PJ7900 Series negative regulators, this series features thermal shutdown and current limiting, making them remarkably rugged. In

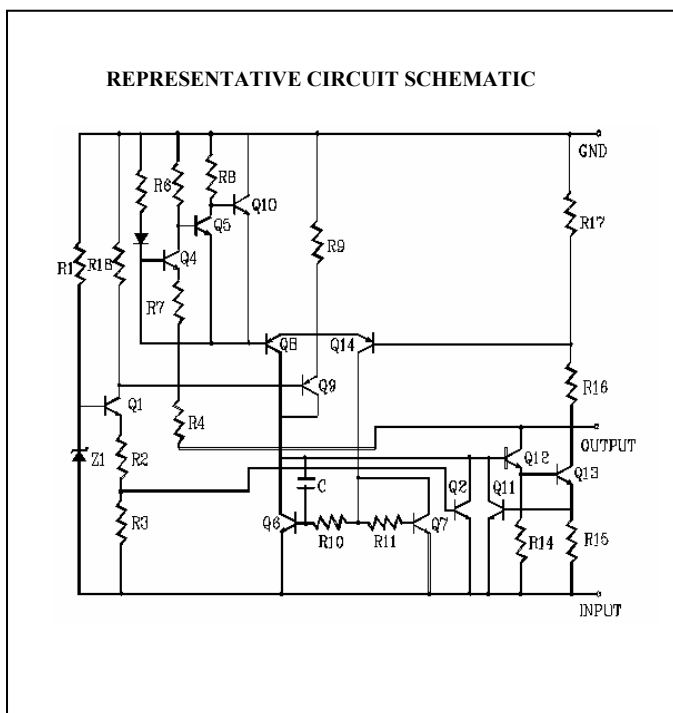

FEATURES

- No External Components Required
- Internal Short Circuit Current Limiting
- Internal Thermal Overload Protection
- Complementary Positive Regulators Offered (PJ78L00 Series)
- Wide Range of Available, Fixed Output Voltages
- Available in $\pm 4\%$ Voltage Tolerance.

ORDERING INFORMATION

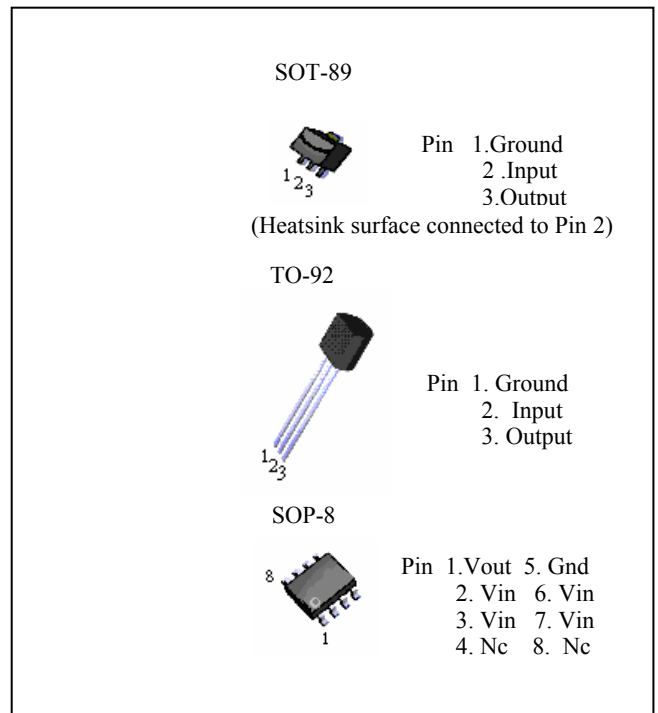

Device	Operating Temperature (Ambient)	Package
PJ79LxxCT	-20°C to +85°C	TO-92
PJ79LxxCS		SOP-8
PJ79LxxCY		SOT-89

CIRCUIT SCHEMATIC

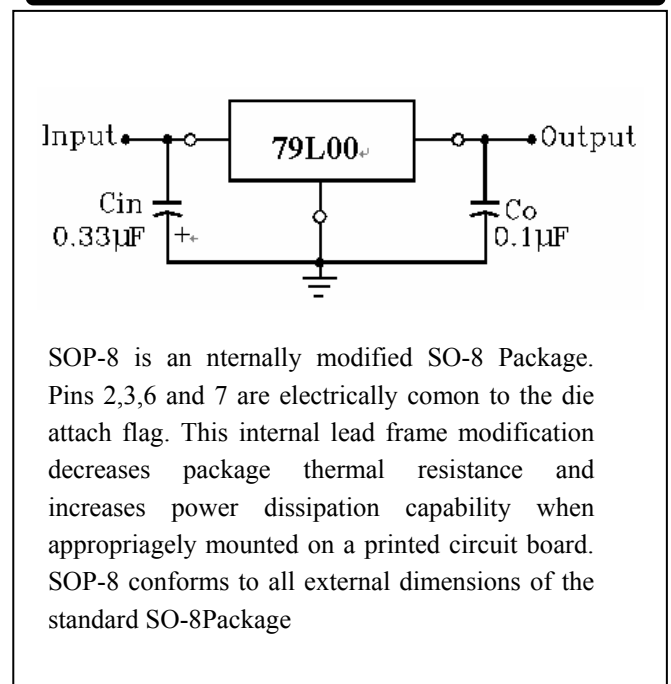

most applications, no external components are required for operation.

The PJ79L00 devices are useful for on-card regulation or any other application where a regulated negative voltage at a modest current level is needed. These regulators offer substantial advantage over the common resistor/zener diode approach.

APPLICATIONS INFORMATION

Design Considerations

The PJ79L00 Series of fixed voltage regulators are designed with Thermal Overload Protection that shuts down the circuit when subjected to an excessive power overload condition, Internal Short-Circuit Protection that limits the maximum current the circuit will pass.

In many low current applications, compensation capacitors are not required. However, it is recommended that the regulator input be bypassed with a capacitor if the regulator is connected to the power supply filter with long wire lengths, or if the output load capacitance is large. An input bypass capacitor should be selected to provide good

high-frequency characteristics to insure stable operation under all load conditions. A $0.33\ \mu\text{F}$ or larger tantalum,mylar, or other capacitor having low internal impedance at high frequencies should be used to minimize ground loops and lead resistance drops since the regulator has no external sense lead. Bypassing the output is also recommended.

FIGURE 1 - POSITIVE AND NEGATIVE REGULATOR

FIGURE 2-STANDARD APPLICATION

A common ground is required between the input and the output voltages. The input voltage must remain typically 2.0 V above the output voltage even during the low point on the input ripple voltage.

* = C_I is required if regulator is located an appreciable distance

from power supply filter.

** = C_O improves stability and transient response.
