

10W AUDIO AMPLIFIER WITH MUTING

DESCRIPTION

The TDA 1910 is a monolithic integrated circuit in MULTIWATT® package, intended for use in Hi-Fi audio power applications, as high quality TV sets. The TDA 1910 meets the DIN 45500 (d = 0.5%) guaranteed output power of 10W when used at 24V/4W. At 24V/8W the output power is 7W min. Features:

- muting facility
- protection against chip over temperature
- very low noise
- high supply voltage rejection
- low "switch-on" noise.

The TDA 1910 is assembled in MULTIWATT® package that offers:

- easy assembly
- simple heatsink

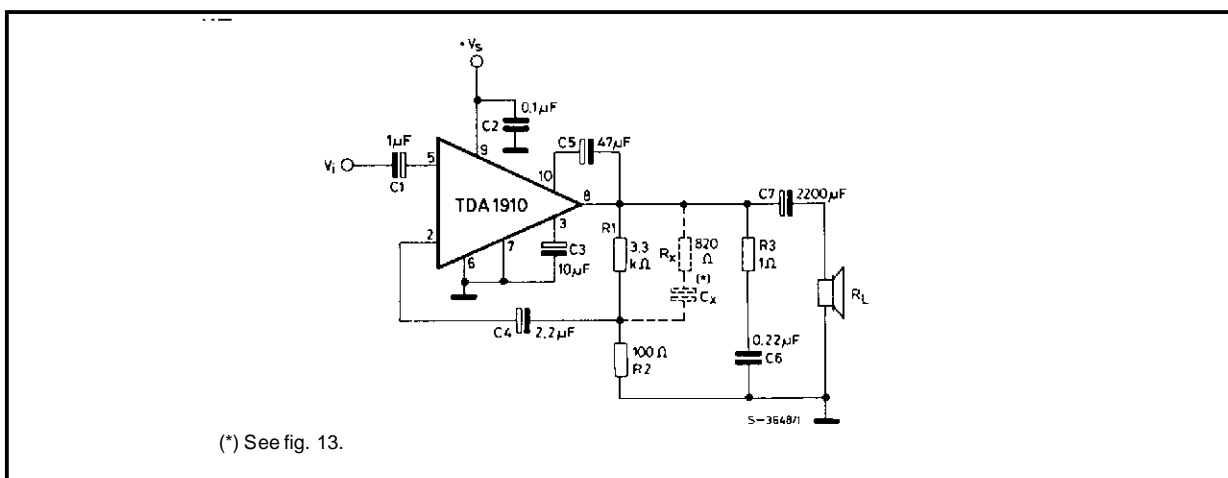

- space and cost saving
- high reliability

ABSOLUTE MAXIMUM RATINGS

Symbol	Parameter	Value	Unit
V_s	Supply voltage	30	V
I_o	Output peak current (non repetitive)	3.5	A
I_o	Output peak current (repetitive)	3.0	A
V_i	Input voltage	0 to + V_s	V
V_i	Differential input voltage	± 7	V
V_{11}	Muting threshold voltage	V_s	V
P_{tot}	Power dissipation at $T_{case} = 90^\circ C$	20	W
T_{stg}, T_j	Storage and junction temperature	-40 to 150	$^\circ C$

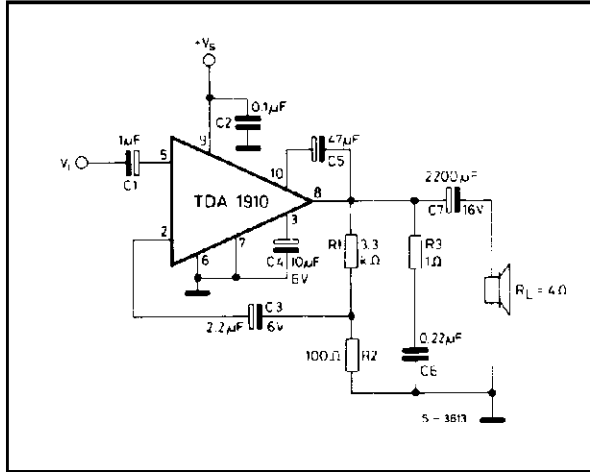

Figure 20. PC board and component lay-out of the circuit of fig. 19 (1:1 scale)

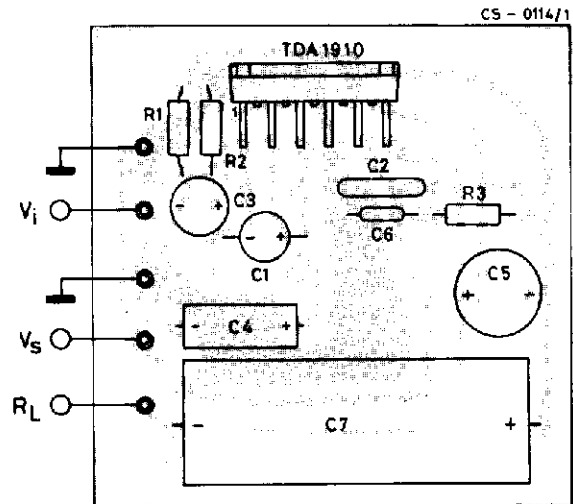

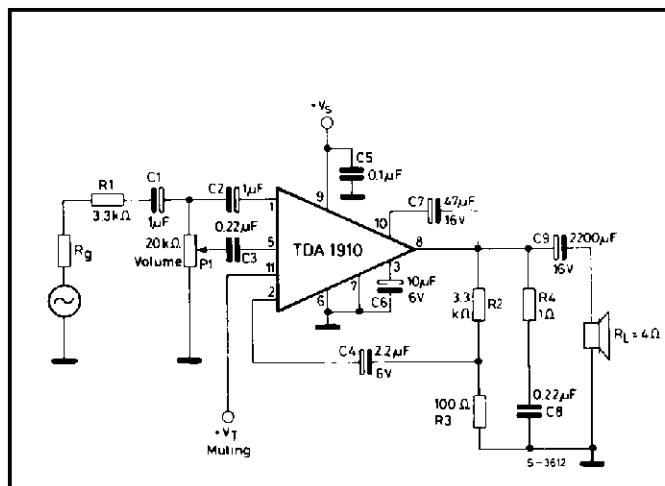

Figure 21. Application circuit with muting

Performance (circuits of fig. 19 and 21)

$P_o = 12W$ (40 to 15000 Hz, $d \leq 0.5\%$)

$V_s = 24V$

$I_d = 0.82A$

$G_v = 30 dB$

Figure 26. Squelch function in TV applications

Figure 27. Delayed muting circuit

MUTING FUNCTION

The output signal can be inhibited applying a DC voltage V_T to pin 11, as shown in fig. 28

Figure 28

The input resistance at pin 1 depends on the threshold voltage V_T at pin 11 and is typically.

- $R_1 = 200\text{ K}\Omega$ @ $1.9\text{ V} \leq V_T \leq 4.7\text{ V}$ muting-off
- $R_1 = 10\ \Omega$ @ $0\text{ V} \leq V_T \leq 1.3\text{ V}$ muting-on
- @ $6\text{ V} \leq V_T \leq V_s$

Referring to the following input stage, the possible attenuation of the input signal and therefore of the output signal can be found using the following expression.

$$A_T = \frac{V_i}{V_5} = \frac{R_g + R_5 // R_1}{R_5 // R_1}$$

where $R_5 \cong 100\text{ K}\Omega$

Considering $R_g = 10\text{ K}\Omega$ the attenuation in the muting-on condition is typically $A_T = 60\text{ dB}$. In the muting-off condition, the attenuation is very low, typically 1.2 dB.

A very low current is necessary to drive the threshold voltage V_T because the input resistance at pin 11 is greater than 150 K Ω . The muting function can be used in many cases, when a temporary inhibition of the output signal is requested, for example:

- in switch-on condition, to avoid preamplifier power-on transients (see fig. 27)

- during commutations at the input stages.
- during the receiver tuning.

The variable impedance capability at pin 1 can be useful in many applications and we have shown 2 examples in fig. 22 and 24, where it has been used to change the feedback network, obtaining 2 different frequency responses.

APPLICATION SUGGESTION

The recommended values of the components are those shown on application circuit of fig. 21. Different values can be used.

The following table can help the designer.

Component	Raccom. value	Purpose	Larger than recommended value	Smaller than recommended value	Allowed range	
					Min.	Max.
$R_g + R_1$	10K Ω	Input signal imped. for muting operation	Increase of the attenuation in muting-on condition. Decrease of the input sensitivity.	Decrease of the attenuation in muting on condition.		
R_2	3.3K Ω	Close loop gain setting.	Increase of gain.	Decrease of gain. Increase quiescent current.	$9 R_3$	
R_3	100 Ω	Close loop gain setting.	Decrease of gain.	Increase of gain.		$R_2/9$
R_4	1 Ω	Frequency stability	Danger of oscillation at high frequencies with inductive loads.			
P_1	20K Ω	Volume potentiometer.	Increase of the switch-on noise.	Decrease of the input impedance and of the input level.	10K Ω	100K Ω
C_1 C_2 C_3	1 μ F 1 μ F 0.22 μ F	Input DC decoupling.		Higher low frequency cutoff.		
C_4	2.2 μ F	Inverting input DC decoupling.	Increase of the switch-on noise.	Higher low frequency cutoff.	0.1 μ F	
C_5	0.1 μ F	Supply voltage bypass.		Danger of oscillations.		
C_6	10 μ F	Ripple rejection.	Increase of SVR. Increase of the switch-on time	Degradation of SVR	2.2 μ F	100 μ F
C_7	47 μ F	Bootstrap.		Increase of the distortion at low frequency.	10 μ F	100 μ F
C_8	0.22 μ F	Frequency stability.		Danger of oscillation.		
C_9	2200 μ F ($R_L = 4\Omega$) 1000 μ F ($R_L = 8\Omega$)	Output DC decoupling.		Higher low frequency cutoff.		

THERMAL SHUT-DOWN

The presence of a thermal limiting circuit offers the following advantages:

- 1) An overload on the output (even if it is permanent), or an above limit ambient temperature can be easily supported since the T_j cannot be higher than 150°C .
- 2) The heatsink can have a smaller factor of safety compared with that of a conventional

circuit. There is no possibility of device damage due to high junction temperature.

If for any reason, the junction temperature increases up to 150°C , the thermal shut-down simply reduces the power dissipation and the current consumption.

The maximum allowable power dissipation depends upon the size of the external heatsink (i.e. its thermal resistance); fig. 31 shows this dissipable power as a function of ambient temperature for different thermal resistance.

Figure 29. Output power and drain current vs. case temperature

Figure 30. Output power and drain current vs. case temperature

Figure 31. Maximum allowable power dissipation vs. ambient temperature

MOUNTING INSTRUCTIONS

The power dissipated in the circuit must be removed by adding an external heatsink.

Thanks to the Multiwatt® package attaching the heatsink is very simple, a screw or a compression

spring (clip) being sufficient. Between the heatsink and the package it is better to insert a layer of silicon grease, to optimize the thermal contact; no electrical isolation is needed between the two surfaces.
